taken place, stating that (i) the backhoe operator had undercut the road surface, and (ii) material on the corrugated pipe was a hardened material (rock, cemented gravel, etc.) that the backhoe could not dig. This is in contrast to his subsequent testimony that no difficulty was encountered while digging the trenches, except for one large rock embedded in a shale area in the west end of trench C. This was apparently on the right wall near the face. However, his testimony indicates that despite some difficulty the rock was removed. Consequently, there is an obvious conflict in Hughes' own testimony. Moreover, the witnesses agree that the upper portion of the west end of trench C was dug in a fill area. CO Moore's unrebutted testimony establishes that it constituted the top five or six feet of material. Hughes admitted that there were approximately ten different kinds of soil at that location from the top of the trench to the bottom thereof. In pertinent part, he described several layers of fill material which had been hauled in and compacted by the highway department as (i) looking like caliche and stuff, (ii) something hauled in and compacted, and (iii) another kind of junk layer, limestone mixed with water. When referring to cemented sand and gravel in the trenches, Hughes testified that (i) it was man-made by the highway department when establishing the fill, (ii) it was composed of smashed limestone and clay, approaching the consistency of one-half sack of man-made cement, (iii) it was so turned out that it was difficult to recognize, and (iv) it would not cave in.[54] To the contrary, the compliance officers felt that this soil fell into

---

[54] Although he made no direct reference to cemented sand and gravel in relation to the fill at this location, his reference to layers of compacted caliche, limestone and other materials appears to fit within this description. Moreover, he referred to cemented gravel on top of the corrugated pipe.

a category of hard and compact. I agree. Again, by Hughes' own admission, he feared the walls in trench C would be affected by the weather and, therefore, installed the corrugated pipe.[55] On another occasion, he referred to placing up barricades when we had a problem on the east side.[56] On the basis of the obvious conflicts in Hughes' testimony regarding the nature and strength of the soil material in trench C, I cannot find it credible. Moreover, even if one assumes arguendo that the fill area was a mixture of limestone or caliche with clay, the result does not change. This would be soil material of a nonhomogenous nature which would certainly not constitute rock, shale or cemented sand and gravel. Furthermore, I find the photographic evidence to be consistent with CO Cunningham's assessment of the soil, a clay type of material which is sloughing off small stones. I further find that (i) the black layer thereunder represents the original topsoil of black clay, and (ii) the bottom portion of the trench at section C-C is a combination of clay and silt. I also find that trench B was dug in hard and compact soil. Here again, unrebutted testimony by CO Moore establishes that at section B-B the fill was approximately five or six feet in depth above the original topsoil.[57] It is only necessary to observe that soil samples were taken by hand with a shovel at levels of one and one-half feet, six feet and eight feet. If the

---

55 He also testified that workers were protected by pipe where there were signs of instability (Tr. 184).

56 The record shows that this is a reference to trench C (Tr. 185-186, 231-232).

57 It was the other end of trench B where the old slurry pit caused the tunnel to cave in.

nature and strength of the soil material was of the character described by Hughes in either the fill area or the area beneath the original topsoil, certainly the soil samples could not have been taken in that manner.[58] In assessing the conflicts in testimony as they relate to trench A, Hughes' initial description of the soil material was a conglomerate type, cemented gravel. He then agreed that it was compacted angular gravel, together with limestone fragments. These descriptions are not necessarily mutually exclusive; however, if they are the same, they are not consistent with his earlier usage of the term cemented, since there is no mention of clay.[59] The effect thereof is to cloud the credibility of Hughes' testimony about the composition of soil material in trench A. To the contrary, testimony by CO Moore does not cast that shadow. He acknowledged that the soil material in trench A was of a different character than that found in the other trenches, stating that fist to head-sized stones were embedded in clay and silt. While he admitted that it closely resembled cemented sand and gravel and approached that category, a careful reading of his testimony reveals that, in his opinion, it was hard and compact at this stage of its development. In summary, I find that a preponderance of the evidence establishes that the soil material was hard and compact in trenches A, B and C. Measurements by CO Moore of the overall dimensions of the trenches, as well as the amount of slope in trench walls at

---

58 Although unnecessary to this decision, I further find that, based on the same facts and reasoning, the soil analysis by Shilstone was consistent with observations of CO Moore.

59 His testimony indicated that his usage of the term cemented in regard to the trenches indicates smashed limestone and clay, a man-made cement in the fill areas approaching the consistency of one-half sack of man-made cement.

sections A-A, B-B and C-C were not controverted by Hughes. I so find. I further find his testimony regarding the deficiencies in sloping of trench walls at sections A-A, B-B and C-C to be correct.

This standard seeks to protect workers in trenches from the hazards of trench walls sloughing off or caving in upon them. On the basis of the unrebutted testimony of CO Moore, I further find that (i) respondent's employees were exposed to the hazard by virtue of their working in trenches B and C during the inspection and having previously worked in trench A, (ii) there was a substantial probability of death or serious physical harm if such an accident occurred (a cave-in of trench walls), and (iii) the hazardous conditions were readily visible and obvious (Tr. 49-50, 80-81; Tr. 50; and Tr. 51).[60] Respondent was in serious violation of the subject standard.

The next issue to be resolved is whether the violation was willful. In order to establish a violation of that character, the evidence must establish that the violation was committed with either (i) an intentional disregard of the requirements of the Act, or (ii) a plain indifference to them. If the employer had a good faith belief that the violative conditions met the requirement of the subject standard, then the violation is not willful. Mel Jarvis Construction Co. 81 OSAHRC 89/B13, 10 BNA OSHC 1052, 1981 CCH OSHD ¶25,713 (No. 77-2100, 1981). In this case, the evidence of record reveals that (i) respondent has been cited for a violation of the same standard on two prior occasions, and (ii) those

---

60 Due to the facts that (i) Davis was on the site on a regular basis, and (ii) Hughes visited the worksite two or three times a day, I find that the requisite knowledge was present if either of them had exercised reasonable diligence. Their knowledge is imputed to respondent.

citations were the subject of settlement agreements, wherein respondent withdrew its notices of contest and which became final orders of the Commission (Tr. 52-59, 187-191, 218, 220, Ex. P-5 through P-8). Indeed, Hughes admits actual knowledge of the requirements of the standard prior to all three inspections (Tr. 190-191). He testified that the prior citations were settled, despite his opinion that their issuance was not justified by the facts, because the Secretary's settlement offers were so low that they did not justify hiring a lawyer and contesting them (Tr. 218, 220). In effect, he testified that CO Moore did not understand the standard when issuing the prior citations or the current one in issue (Tr. 189, 218). In other testimony, he points out that (i) the prior citations were issued at different workplaces than the subject of the current citation, and (ii) different circumstances were encountered at those locations (Tr. 216-220, 229-230). According to CO Moore, soil conditions at the other locations were similar to those encountered at the workplace which was the subject of the current citation, i.e., hard and compact (Tr. 101-104).

I have carefully considered the arguments advanced by the parties in their briefs, together with authorities cited in support thereof, in regard to the issue of whether the violation was of a willful character. Since Hughes was fully aware of the standard, the issue is whether the evidence establishes a good faith defense. The test employed is an objective one, i.e., was respondent's belief concerning (i) a factual matter, or (ii) the interpretation of the standard, reasonable under the circumstances. Wright & Lopez, Inc., 81 OSAHRC 92/D10, 10 BNA OSHC 1108, 1981 CCH OSHD ¶25,728 (No. 76-256, 1981). Under the facts of this case, I conclude that the violation was willful. I cannot overlook (i) the inconsistencies in his testimony regarding the composition and strength

of the trench walls in trench C at section C-C,[61] or (ii) the fact that samples were taken from the trench wall at section B-B by shovel on the date of the inspection. Additionally, on the basis of my assessment of the total evidence of record, including testimony, exhibits and credibility resolutions, I find that a good faith defense has not been established in this matter.

In light of the record and the statutory penalty criteria set forth in §17(j) of the Act, I conclude that a penalty of $2,500.00 is reasonable and appropriate.[62]

## FINDINGS OF FACT

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

1. To avoid repetition, those facts set forth (i) under the headings entitled JURISDICTION and PARTIAL RESOLUTION OF THE FACTS, and (ii) those undisputed facts set forth in the third, fourth, fifth and sixth paragraphs of the foregoing discussion of item 1 of willful serious citation 2 (immediately following a recital of the standard), are hereby incorporated by reference to the extent that they are not set forth hereunder.

2. The OSHA inspection in June 1980 disclosed that three separate trenches (A, B and C) had been dug by respondent's employees.

---

61 These were discussed fully hereinabove, i.e., a fear that weather would affect trench walls, barricades erected after a problem on that side (trench C) and the material on top of the pipe being too hard to dig versus a contrary statement that no problem, except for one large rock, was encountered while digging the trenches.

62 Since the evidence of record does not show the size of the business of the employer, I have assumed that it is small. I have also made this assumption in assessing penalties on the other two violations.

3. All of the trenches significantly exceeded five feet in depth and eight feet in length.

4. The trenches were not shored or braced in any manner.

5. All of the trenches were dug in hard and compact soil.

6. Trench walls above five feet were sloped adequately in some places and inadequately in other places. Where inadequately sloped, they were steeper than a one-foot rise to each one half-foot horizontal.

7. The various dimensions of the trenches were measured by the compliance officers, using a steel tape, a plumb bob and a long pole.

8. Prior to the inspection, a cave-in occurred at the west face of trench C.

9. The compliance officers were able to take soil samples with a shovel at depths of one and one half feet, six feet and eight feet in the right wall of trench B in section B-B.

10. Inadequate sloping was present in those areas designated in Ex. P-2 as A and A, B and B, and C and C.

11. The deficiences in sloping were as follows: the right wall of trench A at section A-A, four feet, five inches; right wall of trench B at section B-B, one foot eleven inches, and left wall, three feet six inches; and the left wall of trench C at section C-C, six feet nine inches and the right wall, five feet three inches.

12. Respondent's employees were exposed to the hazard of trench walls sloughing off or caving in upon them while working in trenches A, B, and C.

13. Hughes, respondent's president, was aware of all facts at the worksite giving rise to the violation. The requisite knowledge was present and is imputed to respondent.

14. If an accident occurred (sloughing off or caving in of trench walls), there was a substantial probability that the result thereof could be death or serious physical harm.

15. Respondent had been cited for a violation of the same standard on two prior occasions at different worksites. As part of settlement agreements in those cases, respondent withdrew its notices of contest. The settlement agreements became final orders of the Commission.

16. Hughes possessed actual knowledge of the requirements of the subject standard prior to the current inspection.

17. The violation of §1926.652(c) was committed with either an intentional disregard of the requirements of the Act or a plain indifference thereto.

18. Respondent was in willful violation of §1926.652(c).

19. The evidence does not establish that the violation of §1926.652(c) by respondent was based on beliefs or opinions which constitute a good faith defense.

20. The appropriate penalty is $2,500.00.

## CONCLUSIONS OF LAW

1. At all times material hereto, respondent was an employer within the meaning of §3(5) of the Act, engaged in a business affecting commerce, and having employees.

2. The Commission has jurisdiction over the parties and subject matter of the proceeding.

3. Respondent was in repeat nonserious violation of 29 CFR 1926.450(a)(2).

4. Respondent was in (serious) violation of §5(a)(1) of the Act.

5. Respondent was in willful serious violation of 29 CFR 1926.652(c).

## ORDER

Upon the basis of the foregoing findings of fact, conclusions of law, and the record as a whole, it is ORDERED that:

1. Respondent's requested findings of fact, to the extent that they are inconsistent with this decision, are denied.

2. Item 1 of citation 3, alleging a repeat nonserious violation of 29 CFR 1926.450(a)(2), is AFFIRMED, and a civil penalty of $125.00 is ASSESSED.

3. Item 1 of citation 1, alleging a (serious) violation of §5(a)(1) of the Act, is AFFIRMED, and a civil penalty of $300.00 is ASSESSED.

5. Item 1 of citation 2, alleging a serious willful violation of 29 CFR 1926.652(c), is AFFIRMED, and a civil penalty of $2,500.00 is ASSESSED.

# NOTICE OF DECISION

Secretary of Labor v. Welltech, Inc.
OSHRC Docket NO. 81-2740

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 5, 1982, and will become the final order of the Commission on September 7, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 7, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

JUDGE'S DECISION
AUG 2 '82
RECEIVED
FINAL ORDER ON
SEP 7 '82

DECISION AND ORDER

Appearances: Marigny A. Lanier, Esq., of Dallas, Texas, for the complainant.

George R. Carlton, Jr., Esq., of Dallas, Texas, for the respondent.

PROCEDURAL HISTORY

After an employee was fatally injured by being wrapped up in the cable of a draw works drum November 25, 1981, on an oil well workover rig on Walters Road near Houston, Texas, the workplace was inspected between November 30, 1982, and December 4, 1981, by a safety compliance officer of the Occupational Safety and Health Administration ("OSHA"), which, on December 11, 1981, issued one citation to the respondent, Welltech, Inc. ("Welltech") alleging that it seriously violated §5(a)(2) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et seq. ("the Act") and the regulation codified at 29 CFR §1910.212

(a)(1) [1] by failing to guard the draw worksdrum. Welltech timely filed a notice of contest December 21, 1981, initiating this proceeding before the Occupational Safety and Health Review Commission ("the Commission") under §10(c) of the Act. Thereafter a complaint and an answer were filed with the Commission. The case came on regularly for hearing in Houston, Texas, on May 18, 1982. No affected employee or representative of affected employees participated in this proceeding. Neither party submitted a posthearing brief.

## THE ISSUES

Welltech's answer admitted the jurisdictional allegations of the complaint. The ultimate issues remaining to be determined are whether Welltech seriously violated §1910.212(a)(1) and, if so, the appropriate penalty.

## DISCUSSION AND OPINION

The factual background.

Charles Borst, a motorman, was fatally injured when he hopped up on top of the draw works drum when it was stopped momentarily—apparently believing that the well servicing rig was being shut down for inspection of the gear box.

---

[1] 1910.212—GENERAL REQUIREMENTS FOR ALL MACHINES

(a) Machine guarding.

(1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are—barrier guards, two-hand tripping devices, electronic safety devices, etc.

Instead, the line on the drum was taken in again at high speed, and Borst was wrapped around the drum by the wire rope. When the line is being spooled in, it forms an ingoing nip point with the drum.

This rig (No. 76) was one of some 400 oilwell servicing rigs operated by Welltech. It was of the two-drum type, that is, it had a draw works (or "main") drum and a sand line drum, and the gear box was between them. The main drum was in front (closer to the rig floor), and the sand line drum was in the back. The sides of the two drums were enclosed by a metal sheet which went down to the ground, with the top bent over the edges of the drums about 4 feet high. The back and part of the top of the sand line drum was covered by a splash guard to keep mud and fluid from the sand line from being thrown over the rig.

The sand line operates down the hole and thus gets muddy. The draw works (or "tubing") line is used only to support the traveling block and the pipe suspended in the hole (sometimes weighing many tons); it is kept oily but does not require a splash guard like that on the sand line drum.

The wire rope lines from both drums go over the crown block in the top of the derrick, but since the draw works drum is closer to the rig its line ascends at a steeper angle (60 to 70 degrees from horizontal) than does the sand line. This makes it possible to cover more of the top of the sand line drum than that of the draw works drum. It is not possible to cover either of them completely since a slot or "window" has to be left in the cover to enable the lines to be spooled out or in.

Rig No. 76, although classified as a well servicing or workover rig, was capable of being used to drill shallow wells (up to 3,000 feet deep) and was

so used about half the time. A regular drilling rig is much larger and has its draw works on the rig floor (Tr.53). Since there is considerable activity on a drilling rig floor, there is danger that a crew member may fall into the draw works; therefore, it is always fenced off. The draw works drum on well servicing rigs, such as Rig No. 76, is characteristically several feet away from the rig floor and below it.

On Rig No. 76 the draw works was located near the foot of the stairs leading from the rig floor to a walkway; it would be to the right of a person coming down the stairs, and the walkway would then lead to the left, away from the draw works. A person coming down the stairs would have to step to the right about two feet from the foot of the stairs to stand between the rig floor and the draw works. On that side of the draw works there was no fence or guardrail, but there was a catline box about two feet high and three feet wide which partially blocked the four-foot-wide opening to the draw works on that side (Tr.118,119).

No member of the Welltech crew had a work station near the draw works or a reason to be near it while the rig was in operation (Tr.84). However, David Nielsen, drilling supervisor for the operator, Texaco USA, happened to be standing on the walkway at the foot of the stairs when the fatal accident occurred. Nielsen testified that Borst came down the stairs, stepped up on top of the catline box until the draw works drum stopped, then stepped over onto the drum just two or three seconds before it started spinning again at tremendous speed (Tr.49-61). Since the drum was spooling in the line, Borst was caught in the nip point and instantly wrapped around the drum with fatal results. Nielsen warned Borst to stay away from the tubing line, but Nielsen did not know whether Borst heard him (Tr.59).

David Mastin, the driller, had talked to Niesen and Borst about a missing link in a chain in the gear box which he thought should be repaired before it caused more serious trouble. Mastin had decided that they would look at the chain as soon as he had made "one more stand", meaning as soon as two lengths of pipe were lowered into the hole. However, the derrickman missed the stand, so Mastin stopped the drum, lowered the travelling block so the derrickman could attach the elevators, then hoisted the travelling block again. He estimated the speed of the draw works drum at 70 miles per hour when he heard Nielsen shout to him to stop (Tr.44-46,50). By then, of course, Borst was dead. Borst had apparently been misled by the extra trip of the block due to the derrickman's missing the stand, so when Mastin had lowered the block and stopped the draw works drum momentarily he stepped on the drum to get to the gear box to look at the chain.

The defense of impossibility of compliance.

Welltech did not plead the affirmative defense of impossibility of compliance, and since it made no closing argument and filed no posthearing brief its position on this matter is not entirely clear. However, most of the testimony of its three witnesses was devoted to proving this defense.

Impossibility of compliance is an affirmative defense, with the burden of proof on the respondent, and it should be pleaded by the respondent at an early stage of the proceedings to give the complainant a fair opportunity to meet it. The Leone Construction Co., 76 OSAHRC 12/E6, 3 BNA OSHC 1979, 1975-76 CCH OSHD ¶20,387 (No. 4090, 1976). Such a defense ordinarily is waived by failure timely to plead it. However, as stated in York Metal Finishing Company, 74 OSAHRC 19/D2, 1 BNA OSHC 1655, 1973-74 CCH OSHD ¶17,633

(No. 245,1974), pet. for review dismissed, No. 75-1554 (3d Cir. 1974),

> "To hold differently would subject an employer to daily penalties for failure to abate a condition that may not actually violate the Act."

Here the incongruous result might be to require respondent to do the "impossible" or to subject itself to penalties in perpetuity. Therefore, this defense will be considered fully.

The Secretary introduced evidence that the draw works drum should have been guarded in the same manner as the sand line drum, that is, with a metal cover (Tr.12,14,47). Welltech introduced evidence that this would have been impossible because of the necessity of leaving a window or slot for the tubing line to move back and forth as it was spooled onto or off of the drum and because the high angle of the tubing line would have placed this slot so near the top of the spool that such a guard would have been ineffective (Tr.81,108, 109).

In addition, Welltech contends that a guard over the top of the drum would conceal the cable on the drum from the driller and prevent his seeing a possible overlap which, due to the tremendous weight borne by the draw works, might cause the cable to cut itself in two, dropping the block on the crew.

The elements of the affirmative defense of impossibility, which must be established by the respondent, are that compliance with the cited standard either was functionally impossible or would preclude the performance of required work and that alternative means of compliance were unavailable. N.J. Lee Constr. Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶23,330 (No. 15094, 1979).

The evidence of functional impossibility of compliance is conflicting.

Compliance Officer Carpena, who had never before inspected an oil well service rig and admitted he didn't know the difference between service rigs and drilling rigs (Tr.18,22), testified that in his opinion the draw works drum could be guarded in the same manner as was the sand line drum (Tr.14) and that he had been told by a representative of the manufacturer of Rig No. 76, Cabot Corp., that, although such rigs had not been so guarded in the past, future models would have the draw works drum guarded (Tr.26).

John R. Reese, vice-president for engineering of Cabot's present owner, Ingersoll Rand Oil Field Products Co. and former Cabot employee, testified that such rigs had never had guards over the draw works drums, that this rig was standard in the industry, and that a guard such as that on the sand line drum would not prevent an employee's stepping onto the drum (Tr. 108, 109). He was not asked whether his company planned to equip future models of this rig with guards on the draw works drums or whether he considered it possible to guard them.

Mastin, who at the time of the accident had had only a few months' experience in drilling or service rigs and had only recently been promoted to driller by Welltech, testified that the draw works drum should have had a guard over the top (Tr.47) and that he had seen guards on such drums on two drilling rigs (Tr.52).

Nielsen, the Texaco drilling superintendent, testified that he had seen workover rigs with guards on the draw works drums of the type contended for by the Secretary (Tr.62,63). His total experience was not developed, but he had worked for Texaco five years (Tr.55).

On the basis of 32 years' experience in the oil fields, Vance Sharpe,

Welltech's loss prevention manager, testified that he had never seen a workover rig with a guard over the draw works drum (Tr.71). He said that Welltech had 400 such rigs and in a dozen or more OSHA inspections it had never been cited for failure to guard a draw works drum (Tr.70,80). He described the partial guard around the draw works, as set forth previously, and said this was considered adequate in the industry (Tr.73,74).

The Secretary introduced into evidence two sets of industry safety standards or recommendations which provided for guards in front of the draw works drum. API RP54, Recommended Practices for Occupational Safety and Health for Oil and Gas Well Drilling And Servicing Operations, First Edition, January 1981, (Exhibit C-5), provides at §8.5.2:

> The draw works shall have a guard in front of the drum to prevent employees from falling into the drum or lines.

This provision is eliminated in vertical regulations for the oil well servicing industry proposed to OSHA by the Association of Oilwell Servicing Contractors (Exhibit R-1). Sharpe, who worked on the drafting of this exhibit, testified that the provision for guarding the draw works drum was eliminated because the industry's safety people felt there was no hazard (Tr.79).

The other publication on this subject was Exhibit C-6, Rotary Drilling, Safety on the Rig, Unit 1, Lesson 10, Third Edition, 1981, published by the Petroleum Extension Service, Division of Continuing Education, The University of Texas, in cooperation with the International Association of Drilling Contractors, on p.17 of which is the statement, "A steel guard should be placed in front of the draw works drum to prevent a floorman from falling into the drum and being caught by the hoisting line."

Finally, Rick Poyner, an insurance executive who said he had inspected "thousands" of oil field rigs (Tr.92), testified that he had never seen a guard on the draw works drum of a service rig (Tr.93), at least on a double-drum unit such as this one (Tr.94).

It is apparent from the evidence summarized above that it is rare indeed for the draw works drum of an oil well service rig to have a guard over its top. In fact, the only witness to testify that he had seen such guards was Nielsen, the Texaco drilling superintendent. There is no reason to question his veracity, impartiality, or expertise. However, he was not asked how many such rigs he had seen that were so equipped.

That it was not industry practice to use such guards is not conclusive of the matter, for it is OSHA's job to improve worker safety and, in the process, push forward the frontiers of such things as machine guards.

Nielsen's testimony does tend to prove that it is possible to guard draw works drums on service rigs in the manner advocated by the Secretary. There is also evidence that such guards are sometimes used on drilling rigs. Mastin, the driller, testified that he had seen them on two drilling rigs. The American Petroleum Institute's Recommended Practices (Exhibit C-5), which is applicable to both types of rigs, provides for " a guard in front of the drum," which apparently means some type of fence rather than the kind of guard here proposed.

The main thrust of Welltech's testimony regarding impossibility of compliance is that the high angle of the tubing line, together with the slot required to allow it to wind on and off the drum, makes it impossible to put a guard on the top of the drum where Borst stepped. It would, however, be possible to have the guard over part of the drum , and it would afford some

protection. An employer is required to provide feasible protection to his employees, even though it is not complete.

Welltech also introduced evidence that a guard over the drum would interfere with the driller's ability to see the drum and tell whether the line is winding on properly. Whether Welltech intended this testimony to help prove impossibility of compliance is uncertain. Actually, it would be more pertinent to a defense of "greater hazard" because Welltech's testimony is to the effect that an overlapping line could sever itself and cause the travelling block to fall on the crew (Tr.94,95). "Greater hazard" is also an affirmative defense which Welltech should have pleaded if it intended to rely on it. In any event, it does not meet the requirements of this defense which are that the hazards of compliance are greater than the hazards of non-compliance; that an alternative means of protection is unavailable; and that a variance application under §6(d) of the Act would be inappropriate. Cornell & Co., Inc., 77 OSAHRC 18/D10, 5 BNA OSHC 1018, 1976-77 CCH OSHD ¶21,532 (No. 9353, 1977). Welltech has shown none of these things.

The second element of the "greater hazard" defense is like that of "impossibility" in that the respondent must show that an alternative means of protection is unavailable. Here an alternative means of protection is available in the form of a fence in front of the drum. A fence would have kept Borst from stepping up onto the catline box and thence onto the drum. One of Welltech's witnesses, Poyner, conceded that such a fence was feasible (Tr. 103). The API standards (Exhibit C-5) and the Safety on the Rig course co-sponsored by the International Association of Drilling Contractors (Exhibit C-6) seem to contemplate a barrier or fence rather than a guard on the drum itself, since they both provide for a guard in front of the drum.

Therefore, assuming that Welltech has proved that it is impossible to

put a guard over the drum and that such a guard would create a greater hazard, it still has not shown that an alternative means of protection was unavailable—or that it used an alternative means of protection that was available.

The Secretary has the burden of proving that a hazard exists for there to be a violation of §1910.212(a)(1). Papertronics, Division of Hammermill Paper Co., 78 OSAHRC 54/C6, 6 BNA OSHC 1818, 1978 CCH OSHD ¶22,898 (No. 76-3517, 1978).

Compliance Officer Carpena based his opinion of the existence of a hazard primarily on the accident in which Borst lost his life (Tr.10). Although he thought that the drum could and should have had a guard on it (Tr.14), the driller, Mastin, testified that there was no danger that a person descending the stairs from the rig floor or using the walkway at its foot would fall into the drum (Tr.18,119). This was because the side of the draw works toward the rig floor was offset about 2 feet and was partially blocked by the 2 x 3 foot catline box and because the stairway had guardrails. However, the route used by Borst was an easy way to the gear box, as Nielsen, the Texaco drilling superintendent, testified (Tr.65). I find that there is sufficient proof of the existence of a hazard. The likelihood of an accident such as Borst's was small, but the possibility of horrible injuries or death was so great if an accident did occur that the employer should have done everything reasonably possible to prevent it. A fence across the open end of the draw works would have been a simple and obvious precaution, whether or not it was feasible to guard the top of the draw works drum.

Machine guards, of course, are intended to avoid dependence on human conduct, skill or experience for safety. B.C. Crocker dba Crocker Cedar Products,

76 OSAHRC 132/B6, 4 BNA OSHC 1773, 1976-77 CCH OSHD ¶21,179 (No. 4387, 1976).

I find this item proved and that the violation was serious in that there was substantial probability that if an accident did occur it was likely to result in death or serious physical harm within the meaning of §17(k) of the Act.

The appropriate penalty.

Section 17(j) of the Act requires the Commission, in assessing penalties, to consider the gravity of the violation and the employer's size, good faith and history of previous violations. These factors need not be accorded equal weight, but the gravity is usually of greater significance than the others. Colonial Craft Reproductions, 72 OSAHRC 11/B10, 1 BNA OSHC 1063, 1971-73 CCH OSHD ¶15,277 (No. 881,1972). Elements to be considered in determining gravity include the number of employees exposed to the risk of injury, duration of the exposure, precautions taken against injury, and the degree of probability of occurrence of an injury. National Realty & Construction Co.,Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 85, 1972) rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

Welltech is a large employer and has previously been cited by OSHA for various violations of the Act at other worksites (Stipulation, Tr.4). There is nothing in the record of this case reflecting on its good faith. The gravity of the violation is high.

The Secretary has proposed a penalty of $560. On balance, I find this penalty appropriate.

FINDINGS OF FACT

1. Welltech is a large firm engaged in the oil well servicing business with over 4,000 employees and over 400 rigs in operation. It is engaged in a

business affecting commerce within the meaning of §3(5) of the Act.

2. On November 25, 1981, Welltech's Rig No. 76 was servicing a well at a location off Walters Road near Houston, Texas. The draw works drum and the sand line drum were located off the rig floor, with the gear box between them and the draw works drum nearer to the rig floor. The sand line drum had a guard over the top as far as possible in view of the necessity to leave a window or slot for the sand line to wind on and off the drum. The draw works drum had no guard over its top. It would have been possible to install such a guard on the draw works drum, but it would not have covered as much of the top of the drum as that on the sand line drum because the tubing line spools on and off the draw works drum at a steeper angle than the sand line does to its drum.

3. The two drums were enclosed on three sides by a metal skirt to a height of about 4 feet. The fourth side, toward the rig floor,was partially blocked by a catline box about two feet high and three feet wide.

4. Charles Borst, Welltech motorman, was fatally injured November 25, 1981, when he stepped up on the catline box and then onto the draw works drum while it was stopped momentarily. The drum was started up again while Borst was on top of it, and he was caught in the ingoing nip point formed by the tubing line and the drum, which was reeling in the line.

5. David Mastin, the driller in charge of the crew in the absence of the toolpusher, had told Borst that after making one more stand of pipe he was going to shut down the rig to look at a chain in the gear box which had a missing link. Borst then went to the draw works in preparation for this operation. Apparently unknown to Borst, the derrickman missed the stand of

pipe, causing Mastin to lower and then raise the travelling block an extra time. Not expecting the block to be raised again, Borst stepped from the catline box to the draw works drum with fatal results.

6. The route taken by Borst was an easy way to reach the gear box. There was no evidence that it could be reached any other way.

7. A guard over the top of the draw works drum would not have afforded complete protection to employees, since it was not possible to cover the whole top of the drum, but enough of it could have been covered to provide substantial protection.

8. The draw works was guarded on three sides, and the fourth side, through which Borst entered, could feasibly have been guarded by a barrier or fence.

9. Due to the tremendous weight supported by the draw works drum and the tubing line, the tubing line could cut itself if it overlapped, thus possibly causing the travelling block to fall to the rig floor. This was a remote possibility and did not pose a greater hazard than the unguarded draw works drum.

10. Welltech has failed to prove the elements of the affirmative defenses of impossibility of compliance and greater hazard.

11. Welltech knew or in the exercise of reasonable diligence could have known of the existence of the hazard posed by the unguarded draw works drum.

12. The proposed penalty of $560 is appropriate.

CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. On November 25, 1981, Welltech was in serious violation of §5(a)(2) of the Act and 29 CFR 1910.212(a)(1).

## ORDER

On the basis of the foregoing discussion and opinion, findings of fact, and conclusions of law, it is ORDERED that:

1. Item 1 of citation 1, issued to Welltech December 11, 1981, for serious violation of 29 CFR 1910.212(a)(1), is AFFIRMED and a penalty of $560 is ASSESSED.

ORDER APPROVING SETTLEMENT AGREEMENT AND DISMISSING COMPLAINT

The parties have entered into a settlement agreement pursuant to Rule 100 of this Commission's Rules of Procedure. In that agreement, filed July 27, 1982, Respondent has certified that a copy of the settlement agreement has been served on the employee representative by mailing to the Secretary-Treasurer, Local 695, International Brotherhood of Teamsters, 1314 N. Stoughton Road, Madison, Wisconsin 53714.

Pursuant to that settlement agreement Complainant moves to dismiss its complaint, as amended by the settlement agreement with no costs, fees or other expenses to the assessed against or awarded to any of the parties. Respondent stipulates to that motion.

It is ordered that the settlement agreement is approved and the motion to dismiss the complaint is granted.

## NOTICE OF DECISION

LADISH COMPANY v. SECRETARY OF LABOR AND VICTORY LODGE NO. 1862, et al

OSHRC Docket No. 82-0018-P

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 9, 1982, and will become the final order of the Commission on September 8, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 8, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

DECISION AND ORDER

Appearances:

T. TIMOTHY RYAN, Esq., Solicitor of Labor, HERMAN GRANT, Esq., Regional Solicitor and KAREN L. MANSFIELD, Esq., Office of the Solicitor, Chicago, Illinois, for RAYMOND J. DONOVAN, Secretary of Labor, U.S. Department of Labor, Respondent.

MICHAEL S. McCAULEY, Esq., QUARLES & BRADY, for Petitioner.

ANDY VICTOREY, Chairman, IAMAW Local 1862, the Authorized Employee Representative

BOBRICK, Judge

Hearing was held in this matter on June 8, 1982, under section 10(c) of the Occupational Safety and Health Act of 1970,

29 U.S.C. 651 et seq., hereinafter referred to as the Act, pursuant to the filing of a Petition for Modification of Abatement by the Petitioner, Ladish Company, and the responses thereto filed by the Respondent, Raymond J. Donovan, Secretary of Labor, U.S. Department of Labor, and the Authorized Employee Representative, Victory Lodge No. 1862, International Association of Machinists and Aerospace Workers, in which the Petition was contested.[1/]

At the hearing, each party indicated that agreement had been reached concerning the terms of abatement as set out in the Petition, which included the abatement dates. The respective positions of the parties as to abatement, as set forth in the Petition as amended at the hearing, was incorporated into a Settlement Agreement. The Settlement Agreement, dated June 25, 1982, is approved and made a part hereof.

Based upon the record in this case and the representations made by all parties who participated at hearing, it is therefore ORDERED that the Petition for Modification of Abatement, as modified or amended by the Settlement Agreement, is AFFIRMED.

Edward A. Bobrick
Judge, OSHRC

Dated: August 9, 1982

Chicago, illinois

---

1/ With respect to contests initiated by an employee, or representative of employees, section 10(c), in applicable part, provides: any employee or representative of employees files a notice with the Secretary alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable, the Secretary shall immediately advise the Commission of such notification, and the Commission shall afford an opportunity for a hearing.

## DECISION

By stipulation of the parties, the question of the validity of a search warrant will control the disposition of all issues in this case. The two citations herein are to be affirmed if the search warrant which authorized the OSHA inspection was valid. If, however, the government evidence is the tainted product of an unconstitutional search, the citations are to be vacated.

## FACTS

From the record submitted, I find the essential facts to be as follows:

On September 5, 1980, an OSHA inspector appeared at respondent Modine's place of business in Racine, Wisconsin. He sought to make an inspection of the premises under OSHA's general administration inspection plan. Permission to inspect was refused. The inspector was informed that respondent did not believe there was probable cause for an inspection.

The following day, Modine's attorney telephoned the OSHA inspector and asserted his belief that Modine's Racine facility was not properly subject to inspection under the general administrative inspection plan. On the same date the attorney wrote a letter to OSHA. In it he stated that the Racine location was the company's headquarters, research and prototype facility; that production was carried on at other locations, not at Racine; and that the Racine facility had a very good safety record.

On January 14, 1981, the OSHA inspector appeared ex parte before a U. S. magistrate and secured a search warrant. Under authority of this warrant an inspection was made which resulted in the present citations.

The respondent contends the evidence obtained pursuant to the search warrant should be ruled inadmissable as having been unlawfully obtained. It claims there was no probable cause for issuance of the warrant because the OSHA inspection program was unreasonable. It also claims the program was not properly set up. And finally, Modine says that in any event, the facility inspected did not fit into the inspection program.

## DISCUSSION

From the time of enactment of the Occupational Safety and Health Act in 1970, until 1978, OSHA officials could inspect any workplace almost as their fancy pleased. Search warrants were not deemed necessary because of the language of the Act. Section 8(a) states:

> In order to carry out the purposes of this Act, the Secretary upon presenting appropriate credentials to the owner, operator, or agent in charge, is authorized --
>
> (1) to enter without delay and at reasonable times any factory, plant, establishment, construction site, or other area, workplace or environment where work is performed by an employee of an employer; and
>
> (2) to inspect and investigage during regular working hours and at other reasonable times, and within reasonable limits and in a reasonable manner, any such place of employment and all pertinent conditions, structures, machines, apparatus, devices, equipment, and materials therein, and to question privately any such employer, owner, operator, agent or employee.

However, in 1978, the U. S. Supreme Court held that Sec. 8(a) violated Fourth Amendment guarantees against searches made without a warrant. Marshall v. Barlow's, Inc., 98 S. Ct. 1816 (1978). The court stated it could find "no justification for federal agents to enter a place of business from which the public is restricted and to conduct their own warrantless search."

Hence, since the Barlow's case, whenever government agents are refused admission to a workplace, they must obtain a warrant before they inspect.

Before a warrant issues, probable cause must, of course, be shown. In the Barlow's case, the Supreme Court set forth what was needed to establish probable cause for OSHA searches. It stated that a showing "that a specific business has been chosen for an OSHA search on the basis of a general administrative plan for the enforcement of the Act derived from neutral sources" would constitute probable cause.

The Barlow's decision recognized that inspections are essential if the laudable objectives of the Act are to be achieved. But at the same time the court wanted to assure that no business would be arbitrarily chosen, or that visits would be made willy nilly or upon whim. That decision reaffirmed that the Fourth Amendment was meant to thwart the unbridled invasion by government agents into the sanctuary of home and shop.

> "The basic purpose of this amendment, as recognized in countless decisions of this Court, is to safeguard the privacy and security of individuals against arbitrary invasions by government officials." Camara v Municipal Courts, 87 S. Ct. 1727 (1967)

While the Barlow's case required search warrants for administrative inspections, it made them easier to obtain than criminal warrants. For a warrant to inspect for the purpose of enforcement of a regulatory statute, only "administrative probable cause" would be required. And, as above noted, administrative probable cause is established if the proposed inspection is pursuant to a general enforcement program derived from neutral sources.

In the wake of the Barlow's decision OSHA devised a "general administrative plan". It was promulgated December 6, 1978, as OSHA Instruction CPL 2.25. This is the plan which the government says was followed in the instant case, and which it claims conforms in every respect to the dictates of the Barlow's case: that it is a "general administrative plan" for enforcement of the Act; that it is "derived from neutral sources"; and that it provides an unbiased, reasonable scheme for selecting sites for inspection, based on national and regional injury statistics.

Under CPL 2.25, industries in the U.S. were ranked according to degree of employee exposure to danger. Those which statistically have the most injuries were placed highest on the list for inspection purposes. Particular types of businesses were classified according to the Standard Industrial Classification (SIC). As a neutral source for names of employers in a SIC classification within a given geographic area (Wisconsin in this case) OSHA used names found in the records of the State unemployment department. These names were then placed on a schedule or "cycle" for subsequent inspection. With some minor exceptions, each employer on a cycle was inspected before moving on to a cycle of lower priority. Within a cycle, priority of inspections was determined by such factors as size of establishment and how much time had elapsed since the place was previously inspected.

The government in the instant case made a comprehensive documentary presentation to the U. S. magistrate. Among other things, the government laid before the magistrate the text of CPL 2.25, and described in detail how that plan was followed in selecting respondent for inspection; that selection criteria was based primarily on worst injury rates; that respondent had at least eighty-five employees at the Racine facility engaged in making prototype heating, cooling, air handling equipment; that the SIC proper category was No. 3433, the 5th most hazardous in the Milwaukee area; that hazards at the plant arose from use of abrasive

wheels, power shears, punch and drill presses, lathes, welding equipment and hand power tools, that could result in cuts, fractures, sprains, amputations, crushing and falling injuries.

From this record the magistrate found probable cause to issue a search warrant. Great deference is to be paid this determination.

In my opinion, the evidence before the magistrate was sufficient to support his finding of probable cause. I concur with his conclusion, implicit in his action approving a warrant, that CPL 2.25 constituted an administrative plan for enforcement of the Act appropriately derived from neutral sources, thus meeting constitutional and judical standards.

Respondent contends that its Racine establishment was improperly classified by the government as a manufacturer of heating equipment (SIC Code 3433). It concedes that it is a manufacturer of heating equipment, but not at Racine. The Racine facility, Modine claims, is the company headquarters where, among other things, prototypes of its products are engineered and built. The manufacture of products to be marketed is done elsewhere.

In my view SIC Code 3433 was a proper classification of the Racine facility. The fact that Modine did fabricate prototype heating equipment at Racine brought it within the broad definition of manufacture, to-wit; something made from raw materials by hand or by machinery. Modine advocates a more restricted definition of manufacturing. It views manufacturing as production on a limited or mass basis for sale to the public. However, even under that concept, SIC Code 3433 would be appropriate, since in Modine's operation, the

building of prototypes is an integral part of the process of manufacturing heating equipment for sale.

Modine also contends that the warrant was invalid because administrative plan CPL 2.25 was not properly adhered to, and as a result Modine was scheduled for inspection out of its proper turn. It claims that taking Modine out of sequence made its selection arbitrary and capricious.

This argument has little merit. According to the evidence presented to the magistrate, Modine was on the third cycle of places to be inspected. All of the work places in cycles one and two had been inspected, except one which was on strike. In the third cycle, two inspections scheduled ahead of Modine had been postponed.[1/] This is the entire basis for Modine's claim of impropriety.

CPL 2.25 allows postponement of a scheduled inspection under certain specified circumstances. The circumstances that were administratively deemed sufficient for postponement in the instant case were fully disclosed to the magistrate.

No comprehensive nationwide program can be expected to function with absolute mechanical precision. Some administrative latitude for making minor adjustments to accommodate special circumstances is necessary, and is provided for in CPL 2.25. In the present instance, the magistrate found that administrative discretion was properly exercised. I concur.

---

1/ These establishments were litigating prior citations and settlement negotiations were in progress. Ostensibly a new inspection would prejudice these negotiations.

Finally, Modine asserts that probable cause for a warrant did not exist because its Racine facility had an injury rate well below that shown by nationwide statistics. However, under CPL 2.25 as it existed on the date the warrant was issued, the injury rate of the specific workplace selected for inspection was immaterial.[1/] And in any event, to support Modine's contention that it's injury rate was less than the national average, we would be required to consider injury statistics of the Modine workplace that were not before the magistrate.[2/] In reviewing a magistrate's finding of probable cause, we are limited to the record before the magistrate. Sarasota Concrete Co. 9 OSHC 1613 (1981).Legal precedent requires me to decline to pursue this contention.

From the record before me, and the stipulation of the parties, I now find and conclude as follows:

1. The OSHA general administrative program, CPL 2.25, used in the instant case meets the "neutral source" criteria of the Barlow's case, and the magistrate was correct in finding probable cause for a warrant from the evidence presented to him.

2. Pursuant to stipulation of the parties the respondent is found in violation of Sec. 5(a)(2) of the OSH Act as alleged in the citations herein; and the penalties as proposed in the citations are appropriate.

---

1/ CPL 2.25 has since been amended, and individual injury rates are now a factor in selection.

2/ The only allusion to this aspect of the case in the evidence before the magistrate was a copy of a letter from Modine's attorney to OSHA in which the attorney alleged that Modine had a "very good"safety record.

It is now therefore ORDERED that

1. Items 1(a) and 1(b) of Serious Citation No. 1 are affirmed, and a penalty of $180 is imposed.

2. Item 2 of Serious Citation No. 1 is affirmed, and a penalty of $240 is imposed.

3. Items 3(a) 3(b) & 3(c) of Serious Citation No. 1 are affirmed and a penalty of $180 is imposed.

4. Items 1 through 10, 11a, 11b, and 14 through 21 of Non-serious Citation No. 2 are affirmed, and no penalties are imposed.

Amityville, New York 11701

DECISION AND ORDER

ORINGER, JUDGE: This is a proceeding under Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651, et seq., (hereinafter referred to as "the Act"), to review a citation issued by the Secretary of Labor, (hereinafter sometimes referred to as "Complainant"), pursuant to Section 9(a) of the Act, and a proposed assessment of penalties thereon issued, pursuant to Section 10(a), of the Act.

This cause arose as a result of one citation being issued against the Respondent by the Complainant, alleging a serious violation of the standard set forth at 29 CFR 1926.451(d)(10) and proposing a penalty of $160.00 therefor.

The description of the allegation of violation in this case, reads as follows:

CITATION NO. 1 FOR SERIOUS VIOLATION

| Standard, Regulation or Section of the Act Allegedly Violated | Description of Alleged Violation |
|---|---|
| 29 CFR 1926.451(d)(10) | Standard guardrails and toeboards were not installed at all open sides and ends on tubular welded frame scaffolds more than 10 feet above the ground or floor:<br><br>Job site - Front of building under construction.<br>Tubular welded frame scaffold.<br>Standard railings were not provided for open sides of:<br><br>1) Scaffold platform 13' above ground level.<br><br>2) Scaffold platform mounted on steel frame over cab of motor vehicle 12' above ground level. |

Abatement was demanded by November 6, 1981.

## TEXT OF THE STANDARD INVOLVED HEREIN

| Standard, Regulation of Section of the Act Allegedly Violated | Text of Standard |
|---|---|
| 29 CFR 1926.451(d)(10) | Guardrails made of lumber, not less than 2 x 4 inches (or other material providing equivalent protection), and approximately 42 inches high, with a midrail of 1 x 6 inch lumber (or other material providing equivalent protection), and toeboards, shall be installed at all open sides and ends on all scaffolds more than 10 feet above the ground or floor. Toeboards shall be a minimum of 4 inches in height. Wire mesh shall be installed in accordance with paragraph (a)(6) of this section. |

## THE ISSUES

1. Whether or not this Respondent, Kenneth J. Herman, Inc., was in violation of the standard set forth at 29 CFR 1926.451(d)(10)?

2. In the event that a violation by this Respondent is found proven, of the standard set forth at 29 CFR 1926.451(d)(10), was the violation properly characterized as "serious"?

3. In the event a violation is found proven, what would be the appropriate penalty therefor?

OPINION

The testimony of record indicates that there were three scaffolds complained of by the compliance officer, however the citation only specifies two. While some of the testimony of the compliance officer was equivocal, the Secretary nevertheless proved that the Respondent was in violation insofar as at least the ends of the scaffolds were concerned. Neither of the scaffolds delineated in the citation had guardrails at the end, which were wholly unguarded.

By the Respondent's own testimony, at least some unguarded ends had to be at least 12 feet above the ground.

Accordingly, giving the Respondent the best of the testimony, the record clearly demonstrates a violation of this standard which is specific in its requirements.

Among its defenses, the Respondent argued that it had another platform under the one upon which the men were working and that in the event of a fall, this would stop them from falling to the ground below. Assuming that this thesis was accurate, the danger of a fall from more than 10 feet above the ground would not exist. The Respondent however, admitted that at the ends of the platform that were unguarded, the men would, in the event of an accident, fall to the ground. Therefore, the hazard existed. The standard does not provide for equivalent protection such as a platform underneath.

The viability of that defense depends upon the concept that the fall would not be to the ground and therefore would be under 10 feet and would not come within the purview of this standard. In order to appreciate the concept, one could liken it to someone who worked on a floor with a hazardous floor hole with another floor beneath it some six feet below. In that case even if it were a 40-story building, the most that an employee could fall would be six feet through the floor hole because there was a floor below and thus could not fall the 40 stories to the ground.

In the instant cause, however, even assuming that such was the case in the instant cause, the ends of each of the platforms involved herein were totally unguarded. Accordingly, a violation is found.

Insofar as the characterization of the violation is concerned, testimony of the compliance officer was that in the event of a fall, fractures, serious injury or death could occur. With this concept, this tribunal agrees. Falls of ten feet, of twelve feet and of less than ten feet have in the past resulted in death or injury and could again reoccur. Insofar as knowledge of the violation is concerned, mere and sheer observation disclosed a lack of guardrails at the ends of the platform. Additionally, the foreman stated to the compliance officer that Respondent forgot to bring its guardrails. Accordingly,

knowledge of the violation and of the failure to utilize guardrails at the ends of the platforms is demonstrated in the record. In consonance therewith, the characterization of the violation as "serious" was proven.

Insofar as the penalty is concerned, this tribunal finds a penalty of $75.00 reasonable and appropriate herein. The Respondent is advised to heed this caveat, however. This standard requires guardrails whenever employees use scaffolds more than ten feet above the ground or floor. This means guarding the ends as well. In the opinion of this tribunal, if the scaffold is six inches or eight inches from the wall, certainly on that side you would not expect a guardrail because a man could not fall to the ground in a space that close to the wall. On the other hand, at the ends of the scaffold, the hazard of falling always exists. The argument that the men are surefooted, that they will not walk to the end, is devoid of merit. Therefore, the Respondent better heed this caveat that he comply with the standard in the future or be faced with a possible citation of repeated violation or willful violation with greatly enhanced penalties in the event of further violation.

This standard is unequivocal in its requirement that standard guardrails be used wherever the scaffold has an unguarded or open end or side.

As the Secretary correctly points out in its brief, the case of Secretary v. Dick Corporation 7 BNA OSHC 1951, is precedential herein. The Commission, in that decision, said, in pertinent part:

> ". . . the Secretary establishes a prima facie violation of § 1926.451(d)(10) by proving that guardrails meeting the specifications of that standard are not provided on the open sides or ends of tubular welded frame scaffolds more than 10 feet above the ground or floor. The burden then shifts to the employer to prove that its scaffold falls within the "equivalent protection" exception." - at p. 1953, column 2.
>
> ", . . . we defined the terms "open sides and ends" as follows:
>
> > The sides and ends of a scaffold are open if the fall hazards addressed by the standard are present. See Marshall v. Western Waterproofing Company, 560 F.2d 947." - at p. 1954, column 1, para. 1.
>
> ". . . Dick interprets § 1926.451(d)(10) as requiring employees either to equip their scaffolds with standard guardrails or to provide their employees with some form of equivalent protection. We do not agree. The cited standard requires that tubular welded frame scaffolds be equipped with a guardrail that is approximately 42 inches high, a midrail and toeboards. Under the clear terms of the standard, the "equivalent protection" language relied upon by Dick refers to the material used in constructing the required guardrail and midrail. . . . Thus, the standard permits employers to construct guardrails (top rails) from materials that provide protection equivalent to that provided by 2 x 4 lumber and midrails from materials that provide protection equivalent to that provided by 1 x 6 lumber. Accordingly, we reject Dick's contention that the standard by its terms permits employers to use means of fall protection other than standard guardrails (top rails, midrail and toeboards)." - at p. 1953, column 1.

Given the unguarded ends of the scaffolds, at least some of which were 12 feet above the ground, under this decision, a finding of violation was mandated, giving the Respondent the best of the evidence.

The Complainant only proved its case insofar as the ends of the scaffolds were concerned. Whether better preparation would have proven the rest of his case is mere speculation. Accordingly, a penalty of $75.00 is found reasonable and appropriate herein.

Having heard the testimony and observed the demeanor of the witnesses and having considered the same, together with the citation, notification of proposed penalty, notice of contest, pleadings, representations, stipulations and admissions of the parties, it is concluded that the preponderance of the credible evidence of record supports the following

## FINDINGS OF FACT

1. The Respondent, Kenneth J. Herman, Inc., is incorporated in the State of New York and does business in the entire tri-state area (Tr. 5 & 6 of Docket No. 81-1664 involving the same Respondent).

2. The distance between the scaffolds and the wall was little. In both cases they were in close proximity to the wall (Tr. 7).

3. The Secretary's Compliance Officer, Mr. Mincieli, has extensive experience in safety inspection of the construction field (Tr. 10 thru 13).

4. This inspection was a general schedule inspection (Tr. 14).

5. This job consisted of alterations to an old supermarket, both inside and outside (Tr. 17).

6. The Respondent used two sets of scaffolds, one of tubular welded steel scaffold mounted on leveling jacks and there was a tubular welded steel frame scaffold mounted on the front and back of a pickup truck (Tr. 17 & 18).

7. The scaffold platform was two feet wide (Tr. 20, See Exhibit C-1).

8. The Respondent also had a tubular welded frame steel scaffold also consisting of two one foot wide aluminum platforms totalling two feet in width (Tr. 24, 25, and Exhibit C-2).

9. The Respondent also had a tubular welded steel scaffold with two one foot wide aluminum platforms mounted on a pickup truck on the frame of the body of a pickup truck (Tr. 30 & 31).

10. There were men working on the different platforms during the days of the inspection (Entire record).

11. The compliance officer used a steel tape to measure the various heights of the platforms (Tr. 1 thru 33).

12. When the compliance officer had a closing conference with the Respondent's foreman, Mr. Pacasoni, and advised him of the allegations of violation, the Respondent's representative said that they had the railings back in the shop and someone forgot to put them on the truck (Tr. 61).

13. Giving the Respondent the best of the evidence, having a work platform on the scaffold, 12 feet above the ground on one side and 10 feet on the other, the Respondent's witness testified that the men would work on both sides so that they would have to be on the 12 foot side as well as the 10 foot side (Tr. 79).

14. The ends of the platform were clearly unguarded (Exhibits C-1 and C-2).

15. In the event of an accident, fractures or death could have resulted (Tr. 38).

16. The unguarded ends of the platforms were obvious and ascertainable by mere and sheer observation (See Exhibits C-1, C-2 and C-3).

Based on the aforementioned findings of fact, opinion and the entire record, the Judge makes the following

## CONCLUSIONS OF LAW

1. At all times herein mentioned, the Respondent, Kenneth J. Herman, Inc., was engaged in a business that affected commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970 and this tribunal has jurisdiction to hear and decide the within controversy.

2. The Respondent, at the time of the inspection herein concerned, was in serious violation of the standard set forth at 29 CFR 1926.451(d)(10) and a penalty of $75.00 is appropriate therefor.

## O R D E R

In view of the foregoing, good cause appearing therefor, it is ORDERED that:

The allegation of serious violation by this Respondent, of the standard set forth at 29 CFR 1926.451(d)(10), is AFFIRMED and a penalty of $75.00 is ASSESSED therefor.

SO ORDERED.

DAVID G. ORINGER, JUDGE, OSHRC

UNITED STATES OF AMERICA

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. Timco Manufacturing Corp.
OSHRC Docket No. 81-1139

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 16, 1982, and will become the final order of the Commission on September 15, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 15, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

William E. Brennan

| SECRETARY OF LABOR | : | |
| Complainant | : | |
| v. | : | OSHRC Docket No. 81-1139 |
| TIMCO MANUFACTURING CORP. | : | DECISION AND ORDER |
| Respondent | : | |

APPEARANCES

FOR COMPLAINANT

Francis V. LaRuffa, Regional Solicitor
U.S. Department of Labor
1515 Broadway, Room 3535
New York, New York 10036
Att: Stephen F. Smith, Esq.

FOR RESPONDENT

Stephen J. Spencer, President
Timco Manufacturing Corp.
603 Dean Street
Brooklyn, New York 11238

## BACKGROUND

This matter comes on for determination upon a Motion by the Secretary of Labor (Complainant), dated May 27, 1981 to Dismiss the late filed Notice of Contest of the Timco Manufacturing Corporation (Respondent). (See Exh. C-1).

This case originated on January 19, 1981 when Compliance Officer (C.O.) Spiegelman of the Occupational Safety and Health Administration (OSHA) went to Respondent's small plant located at 272 41st Street, Brooklyn, New York, in response to a complaint from an employee of this company (See Exh. C-2). The C.O. conducted an inspection at this worksite which was concluded on the following day, January 20, 1981. As a result of this inspection, and pursuant to Section 9(a) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 658(a)(the Act), on January 30, 1981 there was issued to this Respondent, a four Itemed Serious Citation proposing a total of $320 in penalties and a five Itemed Nonserious Citation for which no penalties were proposed. (See Exhs. A-1 thru A-4 attached to Exh. C-1). Pursuant to Section 10(a) of the Act, 29 U.S.C. 659(a) these Citations and proposed penalties were sent by Certified Mail, Return Receipt Requested to "Timco Manfucturing Corp. - 272 41st Street, Brooklyn, N.Y. 11232." (See Exh. B-1 attached to Exh. C-1).

No notice of Contest was filed by Respondent to these Citations until after its president, Mr. Spencer, received a letter from the OSHA Area Director Mr. Kingsley inquiring about

the abatement of the cited conditions and payment of the proposed penalties. By letter dated April 15, 1981, Mr. Spencer requested the Review Commission to review the penalties proposed (See Exh. F attached to Exh. C-1). On May 7, 1981, the Commission acknowledged receipt of this case. (See Exh. G attached to Exh. C-1).

By Order dated July 6, 1981, this case was assigned to Judge O'Connell for determination. Judge O'Connell, pursuant to Notice dated July 13, 1981, held a hearing on August 7, 1981 on the issue of "Whether the Employer's notice of contest was timely filed or not?" (Page J-1-Docket File).

Thereafter, as a result of a major reduction in Commission personnel, Judge O'Connell left the Commission and on February 11, 1982 this case was reassigned to the undersigned.

After affording the parties an opportunity for a de novo hearing or to supplement the record herein with additional evidence, which was declined, the parties agreed to have this case decided on the record as it had been formulated. (See pages J-3, J-4 and J-5, Docket File).

## I S S U E S

The issues presented by this case are:

1. Was a Notice of Contest to the Citations and proposed penalties timely filed by Respondent?

2. If the answer to Issue 1 is in the negative, does Respondent qualify for relief from Commission's Final Order under Federal Rule of Civil Procedure 60(b)?

Both issues are answered in the negative.

## EVIDENCE

The evidence of this record considered in its entirety establishes the following:

The Brooklyn area office of OSHA received a complaint from an employee of Respondent, who did not desire to be identified, on November 20, 1980. This complaint listed nine conditions which, if accurate, could have effected both the safety and health of Respondent's employees. (See Exh. C-2).

C.O. Spiegelman was assigned by the Area Director to respond to this employee complaint, which he did by inspecting Respondent's worksite located at 272 41st Street, Brooklyn, New York.[1/]

Upon his arrival at this small metal fabricating plant on January 19, 1981, the C.O. spoke to a Mr. Blanco who stated that he was "...the manager in sole charge of the plant.(TR.26).[2/] The C.O. asked the identity of the president of the company stating that he wanted "... to contact the president or an officer of the corporation." Mr. Blanco replied, "... that it wasn't necessary, that he was in complete charge, and that the president of the corporation was occupied with other business, and that he would let him know whatever was found."(TR.26).

---

1/ The address given by the complaining employee was 217-41st Street, Brooklyn, N.Y. When the C.O. went to that location he found no building numbered "217" and was told by someone in the neighborhood that Respondent's building was located at 272-41st Street. (Tr. 22,23, Exh. C-2).

2/ TR. references are to pages in the transcript of the hearing held herein.

After an opening conference with Mr. Blanco and two employee representatives, during which the C.O. delivered a copy of the employee complaint to Mr. Blanco and explained the scope of his inspection, the C.O., who was accompanied by OSHA Industrial Hygienist Hochman, conducted his inspection. The inspection was completed the following morning and a closing conference was held by the C.O. with Mr. Blanco and the employee representatives. During this closing conference, all alleged violative conditions were discussed and the C.O. and Mr. Blanco agreed upon dates by which the conditions were to be corrected, ie. abatement dates were agreed upon. All conditions were to be corrected by February 20, 1981 at the latest. Additionally, the C.O. supplied Mr. Blanco with an OSHA booklet entitled "OSHA Closing Conference Guide", going over each subject listed on the back page thereof with Mr. Blanco. (See Exh. C-3). Paragraphs numbered 4, 5 and 6 clearly describe the procedures to follow if an employer wishes to contest a citation, penalty or abatement dates, emphasizing that the notice of contest must be in writing, filed with the Area Director (whose name, address and telephone number is supplied on the next to the last page of the booklet), within 15 working days after receipt of a Citation and Notification of Penalty. C.O. Spiegelman testified that he always emphasized the 15 working day contest period in his closing conferences and wrote "15 working days" on this booklet. (TR. 22-34).

The C.O. then returned to his office, wrote his report of the inspection and recommended the issuance of the Citations herein, which after review by Supervising Compliance Officer Wise, were issued to Respondent on January 30, 1981, being sent by Certified Mail, Return Receipt Requested. (See Exhs. A-1 through A-4 attached to Exh. C-1).

Based on these unrebuted facts it is clear that the inspection was properly conducted by C.O. Spiegelman.

The Citations as issued were directed to: "Mr. Steve Spencer, President - Timco Mfg. Corp. - 272 41st Street - Brooklyn, N.Y. 11232".

The Citation consists of a printed form, in use for many years by OSHA, with space provided for the typed insertion of the name and address of the Employer, the type or alleged violation, the Citation No. as well as space for listing Items, the specifics of the alleged violative conditions. To the right of each Item there is space for the typed insertion of the "Date by which violation must be corrected", and space on the far right side of the form for the typed insertion of the penalty proposed for each listed Item. Thus, in practical effect, the form Citation when completed by the OSHA Area Office, consists of both the "Citation" as mandated by Section 9(a) of the Act, 29 U.S.C.658(a) as well as the notification of penalty as required under Section 10(a) of the Act.[3/]

---

3/ Section 9(a) of the Act provides:

> Sec.9.(a) If, upon inspection or investigation, the Secretary or his authorized representative believes that an employer has violated a requirement of section 5 of this

(Continued)

(Footnote 3/ Continued)

Act, of any standard, rule or order promulgated pursuant to section 6 of this Act, or of any regulations prescribed pursuant to this Act, he shall with reasonable promptness issue a citation to the employer. Each citation shall be in writing and shall describe with particularity the nature of the violation, including a reference to the provision of the Act, standard, rule, regulation, or order alleged to have been violated. In addition, the citation shall fix a reasonable time for the abatement of the violation. The Secretary may prescribe procedures for the issuance of a notice in lieu of a citation with respect to de minimis violations which have no direct or immediate relationship to safety or health.

Section 10(a) of the Act provides:

Sec.10.(a) If, after an inspection or investigation, the Secretary issues a citation under section 9(a), he shall, within a reasonable time after the termination of such inspection or investigation, notify the employer by certified mail of the penalty, if any, proposed to be assessed under section 17 and that the employer has fifteen working days within which to notify the Secretary that he wishes to contest the citation or proposed assessment of penalty. If, within fifteen working days from receipt of the notice issued by the Secretary the employer fails to notify the Secretary that he intends to contest the citation or proposed assessment of penalty, and no notice is filed by any employee or representative of employees under subsection (c) within such time, the citation and the assessment, as proposed, shall be deemed a final order of the Commission and not subject to review by any court or agency.

The following printed sentences appear on the top third of the Citation form:

> This citation describes violations of the Occupational Safety and Health Act of 1970. The penalty(ies) listed below are based on these violations. You must correct the violations referred to in this citation by the dates listed below and pay the penalties proposed, unless within 15 working days (excluding weekends and Federal holidays) from your receipt of this citation and penalty you mail a notice of contest to the U.S. Department of Labor Area Office at the address shown above. (See the enclosed booklet which outlines your responsibilities and courses of action and should be read in conjunction with this form.)

At the top of the column headed "Penalty", the following printed sentence appears in captial letters:

PENALTIES
ARE DUE
WITHIN 15
DAYS OF
RECEIPT
OF THIS
NOTIFICATION
UNLESS
CONTESTED
(See enclosed
Booklet)

At the bottom of this Citation form, the following printed statement appears:

> EMPLOYER RESPONSIBILITIES AND COURSES OF ACTION - The enclosed booklet outlines employer responsibilities and courses of action and should be read in conjunction with this notification.

See Exhibits A-1 thru A-4 attached to Exh. C-1.

Mr. Wise, the supervising C.O. in the Brooklyn Area Office, testified to the proceedures followed in his office in issuing Citations.

The citations are mailed by Certified Mail to the employer with a form, forwarding letter.[4/] There is also enclosed in this mailing the OSHA booklet entitled "Employer Responsibilities and Courses of Action Following an OSHA Inspection", OSHA 3000, referred to in the three printed sentences appearing on the Citation as quoted supra.

The first paragraph of this booklet, entitled "Employer Action Required" advises the employer that he has one of two courses of action to elect upon receipt of a Citation. First, if he agrees with the Citation and proposed penalty, he may correct the condition and pay any proposed penalty. Second, if he disagrees with the Citation, "...within 15 working days, you may elect to contest any or all of the following: Citation, Penalty, Abatement Date. For details, see the section on How to Contest." The paragraphs entitled "How to Contest" and "The Contest Process" clearly and simply point out the steps the employer must take to initiate a contest, including the 15 working day period within which to file his "Notice of Contest" with the OSHA Area Director, as mandated by Section 10(a) of the Act, supra. fn.3, and a brief

---

4/ This form letter refers to an enclosed "...booklet which explains your rights and responsibilities under the Act." This letter in its entirety however, expresses the availability of the Area Director for an "informal conference" and states, "... I [Area Director] am authorized to enter into an informal settlement agreement which amicably resolves this matter without any litigation or contest". Exh. C-6.

description of the procedures before the Review Commission. (See Exh. C-4.)

Also enclosed in the Citation mailing package is OSHA pamphlet 3047, entitled "Onsite Consultation for the Employer". which outlines the availability of "...a free onsite consultation service funded by the Occupational Safety and Health Administration", delivered by state governments or private firm contractors. (Exhibit C-5,p3). This booklet does not cover the issuance of Citations or contests thereof.

The Citations in this case were received by Respondent on February 2, 1981, as evidenced by the executed Return Receipt, Exhibits B-1 and B-2 attached to Exhibit C-1. (The identity of the person signing this receipt is not established in this record, but Respondent does not dispute that the Citations were received at the 272 41st Street address of the Timco Manufacturing Company.)

Thus, the 15 working day contest period mandated by section 10(a) of the Act expired on February 24, 1981 (weekends and holidays are excluded).

Based upon the unrebuted testimony of C.O. Speigelman, that Mr. Blanco was the manager of and in complete charge of Respondent's plant at 272 41st Street, and his assurance that he would notify Timco's president of "whatever was found" during the inspection, the Citations herein were properly issued and served.

The next development in this case was the receipt by the OSHA Area Office of a letter dated March 2, 1981 signed by "Ray Blanco, Manager" on Timco Mfg. Corp. letterhead stationery,

with the Timco address listed as "603 Dean Street - Brooklyn, New York 11238". This letter, addressed to Mr. Kingsley, the Area Director, states that "...corrective actions have been taken..." on the Citations at issue here.[5/]

Mr. Wise testified that in the latter part of March 1981, he initiated a telephone call to Timco's President, Mr. Spencer, "...to follow up on the abatement, and to discuss the penalty that was due".(TR. 76). During this telephone call, Mr. Spencer advised Mr. Wise that he was not aware of the Citation or Mr. Blanco's letter of March 2, 1981. Mr. Wise pointed out to Mr. Spencer that OSHA had received the postal Return Receipt showing receipt of the Citations by Timco. Additionally, it had Mr. Blanco's letter dated March 2, 1981 proving receipt of the Citations because of its content. Further, that because the 15 working day contest period had expired, (on February 24, 1981), under OSHA's Regulations, OSHA could do nothing and suggested that if Mr. Spencer wanted any relief he should write the Review Commission. (TR. 75-77).

Mr. Wise, by a letter dated April 2, 1981 which he wrote and which the Area Director signed, confirmed the major points of his telephone discussion with Mr. Spencer. (See Exhibit C-8.)

---

5/ This letter also refers to a third Citation which involved alleged health violations, (OSHA Citation 1 -H1549-159 (other), issued some two weeks after the two Citations at issue here (Exh R-1). No penalties were proposed on this health Citation and it is not at issue in this case.

During his telephone conversation, Mr. Wise asked Mr. Spencer to which address he wished the confirmatory letter sent, the 603 Dean Street address (the address on the letterhead of Mr. Blanco's March 2, 1981 letter, Exh. D attached to Exh. C-1) or to the 272 41st Street address, to which the Citations had been mailed. Mr. Spencer asked that it be mailed to the 603 Dean Street address. (TR. 43-85;78,79).

Upon the close of Complainant's case in chief, (as well as at the beginning of the hearing), Judge O'Connell went to extensive lengths to explain to Mr. Spencer, appearing pro se., his rights under the Act. Judge O'Connell was particularly concerned because when the 10:00 AM time for the hearing to begin arrived, Mr. Spencer was not present. Judge O'Connell telephoned Mr. Spencer who advised that he had not received the written Notice of Hearing (R.p. J-1-Docket File), despite the fact that it had been mailed to Mr. Spencer at the 603 Dean Street address. Thus the commencement of the hearing was delayed until 11:45 AM, when Mr. Spencer arrived. Because of these developments, both before the hearing began, and at the close of Complainant's case, Judge O'Connell offered Mr. Spencer the opportunity for an adjournment of the hearing to a later date to prepare his case. Mr. Spencer chose to proceed. (TR. 3-7; 85-92).

After a luncheon recess, Mr. Spencer proceeded with his case, appearing as Respondent's only witness. He testified that he was the President of Timco Manufacturing Corporation and maintained his office at 603 Dean Street, Brooklyn, New York. He readily

acknowledged that Mr. Blanco was his manager at the 272 41st Street plant location and that Mr. Blanco was in charge of that relatively small operation which had twelve employees. He stated that he had not been aware of the Citations in this case until his telephone call with Mr. Wise in the latter part of March, which conversation was confirmed by Mr. Wise's letter dated April 2, 1981. (Exh. E attached to Exh. C-1). Mr. Spencer deduced that Mr. Blanco had been confused about the requirement to file a written Notice of Contest within 15 working days of the receipt of the Citations, and theorized that Mr. Blanco probably thought that if the alleged violative conditions were corrected, the payment of the proposed penalties would be excused by OSHA.

After learning of the Citations, Mr. Spencer by letter dated April 15, 1981 to the Review Commission, requested the Commission to "review", and "drop" the proposed penalties. (See Exh. F, attached to Exh C-1).

In his April 15th letter, Mr. Spencer alludes to procedures of the"New York State Labor and Safety Department", which did not access any penalties if violations which were found were corrected within a certain time period.

This letter from Mr. Spencer dated April 15, 1981, is the only document of record which can be construed as a Notice of Contest, and it is so construed. (Exh. F, attached to Exh. C-1).

Mr. Spencer, on cross examination, stated that as of the time of the hearing, (August 7, 1981), Mr. Blanco was no longer employed by Respondent but readily admitted that Mr. Blanco had

been the manager of the 272 41st Street plant at all relevant times herein, with authority to run that business on a day-to-day basis which included authority to discharge employees.

Further, that Mr. Blanco had informed him of the Citations, but he was vague as to precisely when this communication took place, claiming that Mr. Blanco gave him copies of the Citations some time around April 15, 1981 "or later", and that Mr. Blanco advised that all conditions had been corrected.(TR. 105). However, Mr. Spencer claimed that he "...did not know what the contents of the citations were until much later". (TR. 105).

He further stated that Mr. Blanco had the authority to write the letter of March 2, 1981 to the Area Director concerning abatement of the allegedly violative conditions set forth in the citations, and to use the "Timco Manufacturing Corp." stationery, which gives the address as "603 Dean Street", because there was no stationery for the 272 41st Street plant address.

Mr. Spencer stated that his motivation for writing his letter of April 15, 1981 to the Commission (Exh. F attached to Exh. C-1), was that he was upset about the penalties (proposed for the Serious Citation), "Without the opportunity to do anything about it, ..." (TR. 107). In short, Mr. Spencer's position was that because of the confusion over the 15 working day Notice of Contest period, he was upset, "...because we were cut off after that, of not being permitted to have our day in Court or in hearing of these complaints".(TR. 110).

He further stated that he is one of a number of owners of the Timco Company and he operates as President of this concern only out of the 603 Dean Street office. Further, that Timco manufactures its product for only one customer and his function at Dean Street, "...is to take care of the payroll, the finances, and to look at the orders that come in from this one customer, and let Ray Blanco handle the manufacturing end of it, and whatever goes on in the [272 41st Street] shop".(TR. 107). He further stated he "runs" two other companies from his Dean Street office address, with managers for these companies also located at Dean Street.

Lastly, Mr. Spencer stated "...that we did have another case prior to this when Timco was under the name of ATKO Marine, and this was about two or three years ago. At that particular time, because I was notified directly, etc., I took the proper action, and there was no problem". (TR. 112)(TR. 100-113).

## OPINION

The evidence in this case as detailed above clearly establishes the following:

1. The inspection of Respondent's plant located at 272 41st Street, Brooklyn, New York, was properly conducted by the OSHA compliance officer under the provisions of Section 8 of the Act, 29 U.S.C. 657.

2. The two Citations resulting from this inspection were properly issued and mailed by certified mail to this Respondent company's address at 272 41st Street, Brooklyn, New York.

This service of the Citations herein was reasonably calculated to provide this employer with knowledge of the Citations and proposed penalties and an opportunity to determine whether to abate or contest. The service of the Citations herein at the plant site, under the mangership of Mr. Blanco who knew Respondent's president and reported directly to him, complies with the Commission requirements as set forth in Secretary of Labor v. B.J. Hughes, Inc., Docket No. 76-2165; 7 BNA-OSHC 1471,1474 (1979).

3. This Respondent corporation received these Citations on February 2, 1981, a fact undisputed in this record.

4. The 15 working day period within which a written Notice of Contest should have been filed with the OSHA Brooklyn Area Directors office, as mandated by Section 10(a) of the Act, 29 U.S.C. 659(a), expired on February 24, 1981. (See 29 C.F.R. 1903.21(c)).

5. No timely Notice of Contest was filed by Respondent. The only document of record which can be construed as a Notice of Contest, is Mr. Spencer's letter to the Review Commission dated April 15, 1981. This letter was filed beyond the statutorily required 15 working day contest period.

6. The failure of Respondent to file a timely Notice of Contest was in no way attributable to any action or inaction by the Secretary's OSHA representatives. There is no evidence whatever to support a conclusion that this Respondent was misled by OSHA or that its failure to file a timely Notice of Contest

was caused by Complainant's deception or failure to follow proper procedures. See: Atlantic Marine, Inc. v. OSHRC, 524 F.2d 476(5th Cir., 1975); Secretary of Labor v. Banciforte Builders, Inc., Docket No. 80-1920, 9 BNA-OSHC 2117 (1981) and cases cited therein.

7. Under the provisions of Section 10(a) of the Act, 29 U.S.C. 659(a), (quoted at fn 3 supra.), a Citation and penalties proposed thereon become a final order of the Commission, not subject to review by any court or agency, when a Notice of Contest is not timely filed within 15 working days of receipt of the Citation. Saturdays, Sundays and Federal holidays are excluded in computing "working days". See: 29 C.F.R. 1903.21(c).

8. As of the time this decision is issued, Commission precedent holds that, "...in cases where an employer files a late notice of contest, the employer may be granted relief from the final order under the terms of Rule [Federal Rule of Civil Procedure] 60(b)". Secretary of Labor v. Banciforte Builders, Inc., supra., at 9 BNA-OSHC 2117. See also: J.I. Hass Co., Inc. v. OSHRC, 648 F.2d 190, 195,(3rd Cir., 1981).

9. Federal Rule of Civil Procedure 60(b), in pertinent part, provides:

> Rule 60. Relief From Judgment or Order.
>
> * * *
>
> (b) Mistakes; Inadvertence; Excusable Neglect; Newly Discovered Evidence; Fraud, Etc. On motion and upon such terms as are just, the court may relieve a party or his legal representative from a final judgment, order or proceeding for the folling reasons: (1) mistake, inadvertence, surprise,

> or excusable neglect; (2) newly discovered evidence which by due diligence could not have been discovered in time to move for a new trial under Rule 59(b); (3) fraud (whether heretofore denominated intrinsic or extrinsic), misrepresentation, or other misconduct of an adverse party; (4) the judgment is void; (5) the judgment has been satisfied, released, or discharged, or a prior judgment upon which it is based has been reversed or otherwise vacated, or it is no longer equitable that the judgment should have prospective application; or (6) any other reason justifying relief from the operation of the judgment.
>
> * * *

10. Of the grounds set forth in Rule 60(b), only subparts (1) or (6) apply to this case.

The record in this case does not establish a basis to support a conclusion that this Respondent qualifies for Rule 60(b) relief because of "mistake, inadvertence, surprise, excusable neglect" or any other reason which is just.

The mistake which occurred in this case was that of Manager Blanco, in not timely doing what he told C.O. Spiegelman he would do, that is, notify Mr. Spencer, the President of Timco, of receipt of the Citations, ie, what was discovered during the January inspection. Why he made this mistake can not be accurately determined on the evidence of this record, as Mr. Spencer's conclusions as to the reasons for Mr. Blanco's failure to notify him of receipt of the Citations, are not supported by any credible and reliable evidence. Mr. Blanco was not called as a witness by either party. Hence, any statements going to Mr. Blanco's motivation on this point are purely speculative.

Mr. Spencer, by his own testimony, put Mr. Blanco in complete charge of the day-to-day operation of the plant at 272 41st Street, including authority to write the OSHA Area Director concerning abatement of the alleged violation. Thus, Mr. Blanco was a corporate management representative at this worksite. Either Mr. Spencer neglected to advise his Manager Blanco to immediately forward documents such as an OSHA Citation to him, or if so ordered, Mr. Blanco did not comply with such a directive. In either event, this state of facts do not constitute the type of mistake nor neglect which is excusable under Rule 60(b).

Nor does this record contain sufficient evidence to justify relieving Respondent of the effect of the Citations and penalties which have become final orders of the Commission by operation of Section 10(a) of the Act, 29 U.S.C. 659(a) for "any other reason". As pointed out by Complainant, the Citation forms themselves, at three different locations, the OSHA booklet, OSHA 3000, Exhibit C-4 enclosed with the Citations, if read, clearly put an employer on notice of the requirements which must be followed to contest a Citation. Further, the closing conference held by the inspecting C.O., and the booklet left with management's representative, Exhibit C-3, if read, clearly advises employers of their options upon receipt of an OSHA Citation and what steps must be taken if the employer does not agree with any portion of the Citation or Notification of Penalty. It is difficult to envision what more Complainant can reasonably do to advise employers of their rights and procedures which must be followed under the Act to excerise these rights.

## O R D E R

Respondent herein did not file a timely Notice of Contest to the two Citations and Notification of Proposed Penalties issued to it on January 30, 1981.

These Citations and penalties proposed thereon have become final Orders of the Review Commission by operation of Section 10(a) of the Act, 29 U.S.C. 659(a).

There are not sufficient grounds supported by reliable evidence in this record to justify relieving this Respondent of the Commission's final Order under Federal Rule of Civil Procedure 60(b).

Complainant's Serious Citation consisting of four numbered Items and the Nonserious Citation consisting of five numbered Items, issued to Respondent on January 30, 1981, and the penalties proposed thereon constitute final Orders of the Review Commission. Complainant's Motion to Dismiss "Respondent's Late Notice of Contest", Exhibit C-1, is GRANTED.

SO ORDERED.

NOTICE OF DECISION

Secretary of Labor v. Thomas C. Mobilia General Contractors, Inc.
OSHRC Docket No. 81-1534

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 16, 1982, and will become the final order of the Commission on September 15, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 15, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>THOMAS C. MOBILIA GENERAL CONTRACTORS, INC.,<br>Respondent | OSHRC DOCKET NO. 81-1534<br><br>DECISION AND ORDER |

APPEARANCES:

For Complainant,
Francis V. LaRuffa, Regional Solicitor
U.S. Department of Labor
New York, New York
By: Jonathan Kay, Esq.

For Respondent,
Thomas C. Mobilia, President
Thomas C. Mobilia General Contractors, Inc.
Williamsville, New York

Statement of Proceedings:

By letter dated June 16, 1981, Thomas C. Mobilia General Contractors, Inc., of Williamsville, New York (respondent) contested[1/] the civil penalties of $1440 proposed for the citation issued[1/] on May 19, 1981, by the Occupational Safety and Health Administration of the U.S. Department of Labor (complainant) alleging six serious violations of various safety standards concerned with power

---

1/ Under the Occupational Safety and Health Act of 1970, U.S.C. §§651, et seq., citations and proposed penalties are issued after inspection or investigation and these may be contested within 15 working-days, 29 U.S.C. §659(a).

operated tools (item 1), ladders (item 2), and scaffolds (items 3 to 6).

By notice dated October 2, 1981, the matter was set for hearing on November 18, 1981, but on November 12, 1981, the complainant reported that the parties had settled the controversy and those documents were to be filed by December 3, 1981. These papers were sent by complainant to respondent on November 13, 1981. According to complainant's letter of December 14, 1981, respondent had mailed the documents back but these were apparently lost in the mail and, on that date, another set was sent to respondent for signature.

On February 23, 1982, the matter was rescheduled for hearing on March 18, 1982, at Rochester, New York, because no settlement documents had been filed. That site was selected for the convenience of respondent. I arrived from Boston, Massachusetts, and the Solicitor's Counsel from New York City.

No one appeared for respondent, after due notice received, but its President called the courthouse, requested a continuance because certain employees did not appear at a jobsite and he, therefore, could not leave work. The continuance was denied because of the burden and expense complainant had taken on to prepare for trial. Complainant's evidence was heard without respondent's attendance. However, it was afforded an opportunity to show good cause to reopen the record under Commission Rule 62(b) and (c), 29 CFR §§ 2200.62(b) and 62(c).

Respondent's petition to reschedule a hearing was received on April 2, 1982. Its president states that, on the morning of the hearing, two men did not appear at a job which required three men to perform. He had to remain there to avoid a delay in completion required by its agreement and a large financial burden to the company. He could not attend the hearing and sought a continuance.

Complainant's counsel stated at the hearing that some time after the second set of proposed settlement documents were sent to respondent with no

response, he called its president who then informed him that he, the president, was thinking it over[2/] and that he had engaged an attorney. Complainant contacted the attorney but nothing resulted from this. See counsel's affidavit attached to his reply, dated April 8, 1982, to respondent's petition to reopen.

Concerning the emergency at the job site on the morning of the hearing, complainant points out that the OSHA inspection showed respondent to have 26 employees but respondent does not indicate why replacements for the absent men were not selected from these. In short, argues complainant, respondent chose not to attend and granting its petition would only enlarge the hardship, burden and expense already incurred by complainant and this Commission.

Under Commission Rule 62(c), a party's failure to appear will be excused and a hearing rescheduled only upon a showing of good cause. That has been found when the non-appearance is caused by injury, Simpson Roofing Co., 78 OSAHRC 28/D12, 5 BNA OSHC 1836, CCH ¶22,147, severe weather conditions, Herriott Printing Co., Docket No. 10615 (1975), 2 BNA 1702, CCH ¶19,446, or a bona-fide misunderstanding about the hearing date where respondent showed some diligence, National Roofing Corp., 81 OSAHRC 9/A2, 9 BNA 1249, CCH ¶24,977.

But where respondent knows of the hearing date and takes no precautions to assure his representation there and then must elect between two alternatives (come to the hearing or remain at the job site), he does so at his own peril. He consulted but apparently did not retain an attorney to protect him in an event just as occurred here while all other parties appeared prepared. No good cause has been shown to excuse his choice and attendant neglect and foist further expense upon complainant.

---

2/ This then casts a shadow over respondent's claim that the first set of documents were, in fact, mailed to complainant and lost in transit.

In Usery v. Weiner Bros., Inc., 70 FRD 615 (1976), defendant moved to erase a default judgment entered against it for failure to appear because

> The period from the commencement of this action and the entry of judgment is the busiest season in the fruit and vegetable business and I could not devote time to this matter. 70 FRD at 617.

The court found this excuse to be frivolous and denied the motion. A like result is warranted here. I find no good cause to reschedule a hearing to receive respondent's defense and its petition for that relief is denied.

Complainant's Evidence: 3/

Wilford Schall, an OSHA compliance officer for seven years, between May 4 and 6, 1981, inspected the worksite at the Darien Lake Fun Country Amusement Park and Campgrounds, one of the largest campgrounds in the country, where respondent was in the process of building a two-story wooden frame arcade building. (Tr. 10).

Item 1 cites the absence of a guard covering the blade of an eight inch Rockwell Power saw, required by 29 CFR §1926.300(b)(1). One employee used this intermittently every day for a half to one hour and his left hand and leg were very close to the exposed and bucking saw. If it cut him, a permanent or disabling injury could occur. A gross penalty of $600 was assessed for this from which was deducted 20 percent for respondent's size (27 employees); 30 percent for good faith since the officer believed respondent to be safety-conscious with no record of previous injuries; and 10 percent for its history of no previous OSHA citations leaving a net proposed penalty of $240. (Tr. 10-14). The saw was removed from the job site (Tr. 30).

---

3/ Because of its failure to appear at the hearing, respondent was deemed to waive all rights except the rights to receive a copy of the decision and to petition the Commission for review. See 29 CFR §2200.62(a).

Item 2 cites the absence of ladders for access to elevations as required by 29 CFR §1926.450(a)(1). (Tr. 15). Two scaffolds were at the building: a mobile one at the front 19.5 feet high over a concrete pad and a carpenter's bracket scaffold at the rear some 20 feet over hand-packed clay soil (Tr. 16, 21 and 27). Three employees would climb the mobile scaffolds four or five times a day zig-zagging their way up the cross-bracing of the frames. A fall from either the 12 foot or 19 foot levels where work was being done onto the concrete pad would lead to fractures. A gross penalty of $600 was assessed and with the same reductions as above a net penalty of $240 resulted. (Tr. 15-20). The mobile scaffold was removed and ladders were used for employees climbing to the second floor (Tr. 30).

Item 3(a) cites the failure to tightly plank the mobile scaffold's platform at the 19.5 foot level as required by 29 CFR §1926.451(e)(4). Three men worked there most of the shift. There was only one 16 inch wide plank with 42 inches of open space at its rear and 26 inches open between it and the building. A fall to the concrete pad would result in a fracture. (Tr. 20-22, 23). This scaffold was removed (Tr. 31).

Item 3(b) cites the failure to have two 2 x 10 inch planks on the carpenter's bracket scaffold required by 29 CFR §1926.45(m)(5). It contained only one 12 inch plank with 14 to 16 inches open between it and the building. A fall from that 20 foot height would result in fracture. Again for this item a total, gross penalty of $600 was applied and reduced to $240. (Tr. 20, 22-23).

Item 4(a) and (b) cites the failure to have any guardrails on either scaffold as required by 29 CFR §§1926.451(e)(10) and (m)(6). No protection at all was afforded the two employees on the mobile scaffold and the one man on the other who were there for a good portion of the day. A fall could result in fracture and the net $240 penalty was determined as in the other cases. (Tr. 23-25).

Item 5 cites the absence of support brackets not more than eight feet apart on the carpenter's bracket scaffold, 29 CFR §1926.451(m)(3), since on the scaffold here these two supports were 16 feet 4 inches apart. This is insufficient for the weight of the three to four employees atop it at various times and the scaffold could have been pulled away from the wall and fall the 20 feet to the hard clay. Broken bones would likely result. (Tr. 26-27). As in all prior items, the gross $600 penalty was reduced to the $240 net.

Finally, item 6 cites the failure to restrict the overhang or extension of the plank on the carpenter's bracket scaffold to not less than six inches to no more than one foot as required by 29 CFR §1926.451(m)(5). That scaffold's plank went out three feet over each end with two men working on it with one right up against the extension. Most work was done inside the brackets or end supports. But some work could be done from the extension which, because of the length, would cause the platform to tilt and upset sending the men 20 feet down. Fractures would result. Again the $600 gross penalty was reduced to $240. (Tr. 28-29).

Findings and Conclusions:

Considering this evidence, I find that the proposed civil penalties take into account the violations' gravity and the respondent's size, good faith and history mandated by the Act, 29 U.S.C. §666(i) and conclude that the total of $1440 is appropriate for the violations cited.

Paragraphs II and III of the complaint allege that respondent's business affects interstate commerce and no denial of these jurisdictional facts alleged was made. They may then be taken as admitted. I conclude that the Commission's authority to decide this matter is proper. 29 CFR §2200.33(a)(2) and (b)(2).

ORDER:

Based on the foregoing, it is ordered, the proposed penalties be affirmed

and that a civil penalty of $240 be assessed for each of the six violations cited for a total of $1440.

| GREAT SOUTHERN OIL AND GAS COMPANY, INC., | ) | |
| | ) | |
| Respondent. | ) | |

APPEARANCES:

Marigny A. Lanier, Esquire, and Patricia D. Keane, Esquire, Office of the Solicitor, U. S. Department of Labor, Dallas, Texas, on behalf of complainant.

J. Barry Mouton, Esquire, Lafayette, Louisiana, on behalf of respondent.

## DECISION AND ORDER

SPARKS, Judge: On March 25, 1981, the mast of one of respondent's drilling rigs collapsed killing one workman. Compliance Officer Vern Bechtel visited the site of the accident, took measurements and photographs, interviewed employees, and secured documents and other data. As a result of the investigation, a citation for a serious violation was issued which was later amended to "willful", charging respondent with a violation of section 5(a)(1) of the Occupational Safety and Health Act in that guy wires and anchors were not installed in accordance with the manufacturer's specifications and were not tested prior to use.

## ISSUES

1. Whether respondent is engaged in a business affecting commerce and is thereby an employer subject to the Act.

2. Whether respondent violated section 5(a)(1) of the Act, the general duty clause, and if so, the appropriate penalty.

3. Whether the violation, if any, was willful.

## JURISDICTION

Respondent drills oil and gas wells on a contract basis and produces oil and gas. It operates three drilling rigs and five work over and completion rigs. It operates approximately 160 wells (Tr. 56-57).

In its response to requests for admissions, respondent admits it has more than ten employees, but states that "...[a]ll of the oil which is produced by RESPONDENT's business activities is sold off the leased premises to purchasers, who, to the best of RESPONDENT's knowledge, information and belief, do not transport the oil beyond the boundaries of the State of Louisiana." Considering the world-wide production and trade in oil, the production of oil and gas for use within the State of Louisiana is sufficient to affect interstate commerce. Wickard v. Filburn, 317 U.S. 111, 127, 63 S. Ct. 82, 90 (1942); United States v. Wrightwood Dairy Co., 315 U.S. 110, 62 S. Ct. 523 (1942).

In addition, the rig and mast in use were obtained from Dresser-Ideco which has corporate offices in Texas, and were manufactured outside the State of Louisiana (Tr. 56, 71, 134). The use of equipment obtained from and manufactured out of state is sufficient nexus to "affect" commerce. Avalotis Painting Co., 81 OSAHRC 7/B1, 9 BNA OSHC 1226, 1981 CCH OSHD ¶ 25,157 (No. 76-4774, 1981).

It is also noted that, at the time of the hearing, respondent was performing contractual drilling for O'Boyle Energy Company of New York City and Tex-Oil of Houston and during 1981 at least some of its clients were companies located outside Louisiana (Tr. 57-58).

## FACTS AND DISCUSSION

On the day of the accident, respondent's drilling rig number 37, a trailer-mounted rig manufactured by Ideco-Dresser was drilling in St. Martin Parish, Louisiana, at a site identified as Vernon E. Faulconer—J. J. Martin No. 15 well (Tr. 19, 22-23, 56, 59-60). A crew of 22 employees operates the rig (Tr. 93). The rig was described as ". . . an article 701 carrier mounted rig. It is equipped with 108 foot, 268,000 pound mast. This particular rig is also equipped with an 800 horsepower Continental EMSCO pump, generators, and mud system, block preventors and so forth, designed to operate 11,000 foot 24 hours a day" (Ex. R-1; Tr. 59, 77).

Following the fatal accident, Compliance Officer Bechtel determined that the guy wires had not been anchored at the distances stated in the manufacturer's manual nor had the anchors been test pulled prior to use. Those determinations are not disputed.

A survey made after the accident established that the guy wires attached to the mast had not been anchored in a symmetrical arrangement as recommended by the manufacturer. The two anchors placed north of the drilling hole were approximately 61.5 feet and 138 feet, respectively, from the north-south axis, while the two anchors to the south of the drilling hole were 91.5 feet and 138 feet of that axis. The two anchors west of the drilling hole were 68 feet and 30 feet from the

north-south axis and the two anchors east of the drilling hole were 50 feet and 37.5 feet, respectively, from the east-west axis. The anchor in the south-east guadrant, which was 91.5 feet west and 30 feet south of the drilling hole had been pulled out of the ground during the collapse of the rig (Ex. C-2; Tr. 67-69).

The record does not definitely establish the cause of the collapse. The most convincing testimony concerning the cause of the accident was that of Dr. Courtney Busch, who specializes in conducting failure analysis of oil rigs (Tr. 168-169). From his analysis, Dr. Busch concluded the most plausible explanation for the collapse of the rig was that drilling pipe had been stacked unsymmetrically on the right side of the rig which caused the rig to twist slightly which in turn caused the drilling pipe on the left side, which was stacked nearly vertically, to fall onto the other side causing the rig to twist around and fall (Tr. 173-174).

It is well established that the Secretary is not required to show that an alleged violation was the cause of an accident. The Review Commission recently reaffirmed that view in Western Massachusetts Electric Co., 81 OSAHRC 63/B13, 9 BNA OSHC 1940, 1981 CCH OSHD ¶ 25,470 at pp. 31,764-31,765 (No. 76-1174, 1981), as follows:

> . . . [I] t is the hazard, not a specific incident that resulted [in] injury, which is relevant to determining the existence of the recognized hazard. . . .

The proof necessary to establish a violation of the general duty clause was recently reiterated by the Review Commission in Bomac Drilling, 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶ 25,363 (Nos. 76-450 and 76-2131, 1981), as follows:

> In order to establish a section 5(a)(1) violation, the Secretary must show that an employer failed to render its workplace free from a hazard that is recognized, the occurrence of an incident was reasonably foreseeable, and the likely consequence in the event of an incident was death or serious physical harm to its employees. Pratt & Whitney Aircraft, Division of United Technologies Corp., 80 OSAHRC 38/A2, 8 BNA OSHC 1329, 1980 CCH OSHD ¶ 24,447 (No. 13591, 1980), aff'd in pertinent part, No. 80-4102 (2d Cir. April 20, 1981). The Secretary must also demonstrate that there were feasible means available to abate the hazard. National Realty & Construction Co. v. OSHRC, 489 F. 2d 1257 (D. C. Cir. 1973).

In U. S. Steel Corp., __ OSAHRC ___, 10 BNA OSHC 1752, 1757, __ CCH OSHD ¶ _____ (No. 77-1796, June 30, 1982), the Review Commission specifically overruled so much of Bomac as held "reasonable foreseeability" of an incident as a distinct element of a section 5(a)(1) violation.

The hazard alleged by the Secretary in the citation was being ". . . struck or crushed by the unplanned collapse of an Ideco Drilling rig mast . . . ." The Secretary amended the citation and complaint to further allege a means of abating the hazard as follows:

> A feasible means of abating the hazard of a rig collapse would include installation and placement of guy wires on the rig mast and anchors on the gound according to the rig manufacturer's instructions in addition to installing the mast guy wires and anchors to withstand a tension load toward the well at an angle of 45 degrees above horizontal of 10,000 lbs. and verifying by test as alleged;

Respondent states it is ". . . not aware of any drilling industry recognition of what hazards would be involved in an unplanned collapse of a drilling rig" but acknowledges that the collapse of a drilling rig would probably result in death or serious physical injury to an employee present at or on the rig (Respondent's responses to requests for admissions 11 and 12).

The record contains convincing evidence that the collapse of a drilling rig is a recognized hazard in the industry. Mr. Weldon Walker who is employed by Ideco as Engineering Group Leader for Structural Products, testified as follows (Tr. 132, 141):

Q Is the collapse or the unplanned collapse, . . . of a drilling rig a hazard that's recognized by the industry?

A Yes, it is.

The hazard is further described by Mr. Fred Martin, respondent's Manager of Operations, who testified he had seen 35 or 40 rigs which had collapsed due to the horizontal force exerted by improperly stacked drilling pipe (Tr. 79).

Documentary evidence reflects industry concern about the possibility of a collapse of drilling rigs. The Operating Guide for the Ideco rig contains several warnings that improper procedures could result in the rig turning over or collapsing with damage to the equipment or bodily injury (Ex. C-3).

In addition to the general recognition in the industry, respondent has specific knowledge of the danger of a collapsing rig as the same rig, number 37, had collapsed in 1976 (Tr. 60). Respondent's knowledge is sufficient to establish a "recognized hazard." Continental Oil Co. V. OSHRC, 630 F.2d 446, 448 (6th Cir. 1980).

The evidence is convincing that the industry recognizes the collapse of drilling rigs as a hazard in the industry and that respondent was specifically aware of the hazard. Respondent acknowledges that death or serious bodily injury would likely result from such an occurrence.

Respondent's Manager Martin testified there were three sources of horizontal forces which could collapse a rig: (1) wind, (2) improper levelling and (3) improper stacking of drilling pipe (Tr. 75-80). He further testified that guy wires were used primarily to counteract wind load and there was no evidence of wind involvement in this accident (Tr. 75-76). He stated the guy wires were useless in preventing a collapse caused by a shifting of drilling pipe because ". . . if you have sufficient horizontal force for it to twist, [it] destroys the compressive stability of the mast and causes failure" (Tr. 79-80).

Respondent's contention that the accident was caused by improperly stacked drilling pipe was described by its expert witness, Dr. C. C. Busch. Dr. Busch has a Ph.D. degree from Harvard University in mechanical engineering and is licensed both as a mechanical engineer and as a metallurgical engineer. He specializes in performing failure analysis of rigs and derricks (Tr. 168-169). Dr. Busch was employed by respondent to determine the cause of the failure of rig 37 (Tr. 170). After investigation he concluded the mast failed by twisting clockwise and falling over in a right rear quadrant (Tr. 171). His explanation for the failure was that drilling pipe was stacked unsymmetrically on the right side of the rig which caused the rig to twist slightly causing the pipes on the right side which were standing nearly vertically to fall onto the other side which in turned caused the rig to twist around and fall (Tr. 173-174). Dr. Busch was of the opinion that guy wires which could withstand force of 10,000 pounds as suggested by the manufacturer would not have prevented the collapse of the rig in this case (Tr. 173). He also agreed that guy wires are to offset wind, stating as follows (Tr. 173):

> A Stabilizing guys are there for — to stabilize due to wind load and not meant to hold the structure upright when it's in a failure mode.

He found no evidence of any wind loads at the time of the accident and the record does not contain evidence that wind forces caused or contributed to the accident (Tr. 173).

The testimony of Dr. Busch and other evidence are convincing that properly anchored guy wires would probably not have prevented the collapse of rig 37 on the date of the fatal accident.

The record contains substantial evidence, however, that properly installed guy wires and anchors are a feasible means of reducing the incidence of collapsing rigs.

Complainant produced the testimony of two expert witnesses, who did not visit the accident site nor attempt to determine the cause of the accident, but did offer probative evidence concerning the effect of the improperly placed anchors and guy wires. Dr. Aravamudhan Ramon, professor of mechanical engineering at LSU, emphasized the importance of the symmetrical arrangement of the anchors and guy wires. The imbalance resulting from the failure to place the anchors at the distances prescribed by the manufacturer caused the anchor which pulled out of the ground to bear 2.7 times the force of its opposite anchors (Tr. 101, 107-108).

Mr. Weldon Walker, Engineering Group Leader for Structural Products, has been employed by Ideco for 20 years. His department is responsible for designing the masts and structures of the drilling rigs (Tr. 132). Mr. Walker left no doubt as to the importance of the guy wires (Tr. 140):

> Q . . . how important is it that this mast is rigged properly then, or guyed properly, guyed in accordance with the instructions?
>
> A It's very important that the small self-propelled, or the mast on a small self-propelled rig be properly guyed. The structural integrity of the mast depends upon the guy wires.

The significance is demonstrated by the instructions furnished with the rig. Five copies of the operations manual containing diagrams for guying the rig are furnished with the rig. A brass plate affixed to the base of the mast gives a guying diagram and, if requested, the company, Ideco, will send a serviceman to advise the customer concerning placement of the guying anchors (Tr. 139). The information is considered necessary to the successful operation of the rig (Tr. 151-152). Mr. Walker further testified that improperly placed anchors is a "common problem" of rigs which have experienced an accidental collapse (Tr. 142).

On cross-examination, Mr. Walker agreed that the primary design criteria for the system of guy wires and anchors was to stabilize the mast in high winds (Tr. 160-161, 164-165). He has also known them to provide stability in other situations such as shifting drilling pipe, which according to respondent's expert witness, was the cause of the accident (Tr. 160-162). He testified as follows (Tr. 156-157):

> A That's the design criterion for that stabilizer — excuse me, for that guy wire except we know of instances where these guy wires have done more than stabilize a mast during a high wind situation.
>
> Q What more do they do, sir?
>
> A Well, I know of some instances where guys became slack, the foundation gave way for whatever reasons, you had some subsidence and pipes started moving and the boards started twisting around the mast until the guy wire became tight and if the anchor is sufficient, I've seen them hold —
>
> * * *
>
> Q 10,000 pounds of tension load on the anchor. That's all you require, isn't it?
>
> A Well, our requirement is not intended to hold a rig up in such an instance. I was merely relaying to you —
>
> Q Oh, it's not intended to do that? I thought that's why we were here today. The rig is not supposed to be held up by that guy wire? That's not the purpose of it?
>
> A Is that a question, sir?
>
> Q Yes. You just said it's not intended to hold up a rig in a circumstance where it starts to fall, is that your statement?
>
> A In the instance that I was citing where a guy wire becomes slack and the — board twists around the mass [sic] and it allows pipe to move, pipe to swarm, and the — board continues to twist around the mast and perhaps it gets several degrees, 10 or 15 degrees twist in it, and then the guy wire becomes tight and I've have seen instances of this when a sufficient guy anchor held the rig up and stopped its fall.

A safety manual for drilling contractors published by the International Association of Drilling Contractors specifies that guys should be ". . . utilized according to the manufacturer's specifications" (Ex. C-4). The guys are referred to as "wind guys." Regulations of the State of Wyoming require the use of guy wires according to the manufacturer's requirements (Ex. C-15).

The Secretary also suggests the anchors be pull-tested up to 10,000 pounds prior to use. There is evidence that the anchors of the type used can withstand tests to that degree. A test in a location near the site of the anchor which failed withstood tension of more than 11,000 pounds (Ex. C-10).

In summary, the evidence establishes that the guys and anchors were not erected as specified by the manufacturer of the rig and were not tested prior to use. Even if the guys had been properly erected, it is doubtful they would have prevented the collapse of the drilling rig in this case, although they have prevented the collapse of rigs in some such instances.

As previously stated, however, respondent expressed surprise on several occasions when it was advised that the inquiry was not focused on the cause and prevention of the fatal accident, but whether it had violated regulations or the general duty clause (Tr. 39-41, 51-54).

It is entirely foreseeable that any of the conditions which contribute to the collapse of drilling rigs, wind, instability or improper pipe placement, could possibly arise at respondent's operations. The guy system was designed especially to prevent collapse caused by high winds but has been shown effective in withstanding other forces. Moreover, to be "feasible" it is not necessary that the method of abatement proposed eliminate the hazard. It is sufficient if it materially reduces

the risk of the hazard. Bomac Drilling, A Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶ 25,363 (Nos. 76-450, 87-2131, 1981); Noble Drilling Corp., 78 OSAHRC 96/C12, 6 BNA OSHC 2108, 1978 CCH OSHD ¶ 23,157 (No. 15405, 1978).

Although the installation of guy wires in accordance with the manufacturer's recommendations and performing a "pull test" prior to use would not insure against all collapses of rigs, they are feasible means of materially reducing the risks of collapse not only in high winds but in other conditions. A violation of section 5(a)(1), the general duty clause, has been established.

The Secretary amended his complaint and citation to propose that the violation be characterized as willful and a penalty of $10,000 be assessed. Without question the collapse of a rig can result in death or serious bodily injury. Such collapses occur with such frequency they are a reasonably foreseeable hazard. The assignment of workers not familiar with locating anchors and guy wires and the failure to supervise their placement permitted a hazard to exist for which there was a feasible means to materially reduce the hazard.

The Secretary has a more onerous burden of proof to establish a willful violation of the general duty clause than such violation of a regulation. The Review Commission in Kus-Tum Builders, Inc., 81 OSAHRC 97/B2, 6 BNA OSHC 1166, 1981 CCH OSHD ¶ 25,738 at pp. 32,105-32,106 (No. 76-2644, 1981), stated as follows:

> The Commission characterizes a violation as "willful" if it was committed with either an intentional disregard of, or plain indifference to, the Act's requirements. Mel Jarvis Construction Co., OSHRC Docket No. 77-2100 (RC, September 30, 1981). This position is consistent with the views of the United States Courts of Appeals for the First, Second, Fourth, Fifth, Sixth, Eighth, Ninth, Tenth and District of Columbia Circuits. . . .

* * *

> The Secretary's burden of proving willful conduct is notably more difficult when an employer is charged with a willful violation under a general standard or "the general duty clause," section 5(a)(1), rather than a specific standard. St. Joe Minerals Corp. d/b/a St. Joe Lead Co. v. OSHRC & Marshall, 647 F. 2d 840 (8th Cir. 1981). In particular, a more concrete evidentiary showing is required to prove willfulness in this context. Where a willful violation of section 5(a)(1) is alleged, the Secretary has the burden of proving the employer's intentional disregard of or its plain indifference to its statutory duty to furnish a workplace free from recognized hazards that are causing or likely to cause death or serious physical harm. Id. at 848. Thus, "there must be evidence, apart from that establishing knowledge of the hazard, from which we may reasonably conclude that the employer intentionally disregarded or was indifferent to the safety of the workplace." Id. at 848-849.
> [Citations omitted].

The violation here, though serious, was not willful. It was the result of careless oversight by assigning the duty of locating the guy wires to a worker who was not trained or experienced in that task. The meager facts concerning the previous collapse do not suggest a different result.

Considering the gravity of violation, the history, size and good faith of the company, a penalty of $900 is appropriate.

## FINDINGS OF FACT

1. Respondent has employees and is engaged in drilling for oil and gas and operates producing wells.

2. Some of respondent's customers are located outside the State of Louisiana.

3. Respondent purchases goods and materials from outside the State of Louisiana.

4. In late March, 1981, respondent moved drilling rig number 37 to a new location and began erecting it to begin drilling operations.

5. Roland Veillon, a driller without experience in placing and erecting the anchors and guy wires, was assigned that task (Tr. 90-95).

6. The guy wires were not placed in the symmetrical arrangement as recommended by the manufacturer, nor were the anchors "pull-tested" after they were installed (Ex. C-2, C-3; Tr. 93).

7. The unplanned collapse of a drilling rig is a recognized hazard in the industry.

8. Respondent had specific knowledge of the hazard of an accidental collapse of a drilling rig as a result of the prior collapse of rig 37.

9. The placement of the anchors and guy wires on rig 37 on March 25, 1981, substantially reduced the ability of the rig to remain stable when subjected to horizontal forces.

10. A symmetrical system of guy wires and anchors as recommended by the manufacturer and pull-testing the anchors are feasible means of materially reducing the destabilization effect of horizontal forces which could cause the collapse of a drilling rig.

11. The collapse of a drilling rig operating under conditions of rig 37 was reasonably foreseeable.

12. Respondent's place of employment was not "free" of a recognized hazard.

13. The collapse of a drilling rig would likely result in death or serious bodily injury.

14. The evidence does not establish that respondent showed intentional disregard or plain indifference to the requirements of the Act.

15. A penalty of $900 is appropriate.

## CONCLUSIONS OF LAW

1. Respondent is an employer engaged in a business affecting commerce who has employees and is subject to the jurisdiction of the Act and this proceeding.

2. Respondent violated section 5(a)(1) of the Act, the general duty clause.

3. The violation was serious but not willful.

4. A penalty of $900 is warranted and appropriate.

5. Abatement within five days after this order becomes final is reasonable.

## ORDER

1. The citation is affirmed as a serious violation.

2. A penalty of $900 is assessed.

3. The violative conditions shall be abated within five days after this order becomes final.

Dated this 16th day of August, 1982.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION
John W. McCormack Post Office and Courthouse, Room 420
Boston, Massachusetts 02109

NOTICE OF DECISION

Secretary of Labor v. Bethlehem Steel Corporation, (Lackawanna Plant)
OSHRC Docket No. 79-5257

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 23, 1982, and will become the final order of the Commission on September 22, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 22, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>BETHLEHEM STEEL CORPORATION,<br>(LACKAWANNA PLANT),<br>Respondent | OSHRC DOCKET NO. 79-5257<br><br>DECISION AND ORDER |

APPEARANCES:

For complainant,
Francis V. LaRuffa, Regional Solicitor
U.S. Department of Labor
New York, New York
By: Michael R. Adams, Esq.

For respondent,
George B. Levasseur, Jr., Esq.
Bethlehem, Pennsylvania

For affected employees,
John Choinski, Safety Chairman
Local 2601, United Steelworkers of America
Buffalo, New York

Statement of Proceedings:

By letter dated September 21, 1979, Bethlehem Steel Corporation (respondent) contested[1/] a citation issued[1/] August 31, 1979, as amended September 11, 1979, by the Occupational Safety and Health Administration of

---

1/ Under the provisions of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§651, et seq., citations are issued after inspection [§658(a)] and may be contested within a 15 working day period [§659(a)]. A hearing is then afforded to resolve the issues [§659(c)].

the U.S. Department of Labor (OSHA or complainant) alleging[2/]:

> (1) a repeated violation of 29 CFR §1910.23(c)(1) in that the no. 2 mold platform was improperly guarded on three sides by a rail 21.5 inches from the floor rather than by standard guardrails required by the standard and a civil penalty of $1400 was proposed; and
>
> (2) a serious violation of 29 CFR §1910.309(a) or, in the alternative, 29 CFR §1910.309(b), in that flexible wiring or cords were used in a prohibited manner for which a civil penalty of $700 was proposed.

These alleged violations took place at respondent's Lackawanna, New York, facility.

The matter was heard on October 29, 1980, with all parties and affected employees represented. Respondent admits the jurisdictional facts alleged in the complaint and I conclude that the Commission's authority to decide this matter is proper. 29 U.S.C. §§652(5) and 653(a). Complainant and respondent filed post-hearing briefs on February 6, 1981.

The Evidence:

I] Citation No. 2: An alleged repeated violation of 29 CFR §1910.23(c)(1).

William Wagner has been an OSHA compliance officer for six years conducting about 300 inspections in that time. He has been, over his career, working in the field of safety for almost 25 years. (Tr. 8-9).

He inspected the no. 2 mold platform on July 17, 1979, where empty molds are cleaned by two employees with a Vac-al unit, a large industrial vacuum cleaner measuring 12 by 14 feet. (Tr. 10-12). The officer described these molds as being 12 feet deep and 30 inches square at the top (Tr. 14). These are brought under the no. 2 platform on rail flatcars. That platform, extending in

---

2/ The notice of contest embraced all items of three citations issued. At the outset of the hearing the parties disposed of all of these save the two described above and the order below conforms with the parties' agreement as to the non-tried items.

part over the rails, is about nine by nine feet square and guarded all around by the standard guardrails except at two areas: at the two stairs giving access to it; and at an area over the tracks where a section measuring 40 by 60 inches was cut out. The empty molds are moved under this cut-out section. Iron pipe rails 21.5 inches high surround this section on three sides and the fourth, the edge of the platform itself, is guarded by the top rail of the standard guardrails (Exs. C-5 and R-7).

The Vac-al unit is to the rear of the platform and the tube and hose, whose diameter is six to eight inches and is some 10 feet long, extend over the platform to the cut-out section where the two employees would bend to push it down into the mold holding onto its bar and vacuum dusts and debris from the mold. Some force is required to overcome the pull of the unit's counterweight and when the men release the bar, the hose raises itself. (Tr. 12-14, 55-56). At times, an employee would use a 10-foot rod with magnet attached to retrieve metal pieces the vacuum could not remove. Doing this, he saw an employee bending over the 21.5 inch rail with one foot on it. (Tr. 21-22, 56).

The officer stated that a standard guardrail, 42 inches in height, would preclude performance of this work[3/] (Tr. 14). But the circumstances do expose the two employees to a grave falling hazard of 12 to 14 feet into a mold which might be hot or onto the tracks. This could result in fractures or permanent disability. The 21 inch rail only provides a false sense of security. (Tr. 20-21, 25-26). His investigation revealed no incident of a fall (Tr. 54) and he doesn't think that a mold is seven and a half feet deep (Tr. 53). This obvious fall hazard, according to the officer, could be cured by the use of safety belts

---

3/ Complainant and the employee representative stipulated this point: "...the ...work could not possibly be performed." (Tr. 7)

tied off to the rail as is done at the no. 3 platform and worn at all times (Tr. 22 and 24, 28, 57). A foreman at the site, Mr. Zuffranieri, told the officer that he would have the men put on the belts and tie-off (Tr. 24-25). Mr. Zuffranieri denied making such a statement and he could not since the respondent's General Superintendent would have to approve a policy requiring their use on this platform (Tr. 172-173). The belts have been tried by new employees but quickly discarded. Belts are required and worn only on the main platform. (Tr. 174-175).

Officer Wagner recommended a civil penalty of $700 based mainly on the gravity of the violation and this was doubled because it is alleged to be repeated (Tr. 27-28). In 1977, respondent received a similar citation but that matter was settled after an amendment to cite a violation of 29 CFR $1910.132(a) which requires the use of personal protective equipment (safety belts) because of hazards encountered (Tr. 26, Exs. C-6 and C-7).

John Choinski, a union safety man representing the affected employees, testified that the use of safety belts would create a greater hazard (Tr. 81) and stated for 70 employees that the work couldn't be done wearing the belts or harnesses (Tr. 88-89). Mr. Choinski has been Local 2601's safety representative for eight years and works at the plant. He is familiar with the operations of the molding platform. (Tr. 79-80).

In his opinion, the drop of six to eight feet and then the sudden snap when the lanyard is fully extended would cause more bodily harm than falling about 13 feet into the mold (Tr. 81). That snap and banging causes spinal and internal injuries (Tr. 86). It is also very difficult, needing three men, to pull a man up who is suspended by the belt and this action aggravates injuries. And those three men would be in a precarious position. All one could really do

is cut the rope. (Tr. 82). Furthermore, the rail cars are operated by remote control and if an unauthorized signal, a gypsy signal, moves them at the wrong time with the vacuum tube in the mold, the whole platform goes with the employees tied off there (Tr. 83-84). He knows it takes times to unhook (Tr. 93). Without a belt, a man could escape the platform (Tr. 92). Gypsy signals have moved trains at the wrong time (Tr. 90).

Mr. Choinski believes there is a falling hazard present but knows of no instance of such an event (Tr. 85). The men do hold on to the rail on the vacuum's pipe when bending over and this does provide some support (Tr. 91-92).

As the safety representative, Mr. Choinski requested of Dr. Eulah Bingham (the former Assistant Secretary of Labor for Occupational Safety and Health) an investigation of this problem and she promised him one over a year ago (Tr. 82-83). The union has made several suggestions two of which are: (1) vacuum the tops of the molds separately so there would be no open hole at the platform where the tops are now cleaned. When the inner parts are vacuumed the men are holding on to the bar; and (2) have the vacuum pipe motor driven to eliminate the pipe's counterweight and force. He couldn't recall the other suggestions made. He believes these should be studied by the plant engineers to eliminate all the hazards. (Tr. 84-85).

Respondent called Joseph P. Eagan, its Senior Corporate Safety Engineer (Tr. 95), who testified that the prior citation referred to by Officer Wagner concerned a different mold platform and a different operation. That platform is much larger and wide open with no rails where the molds came through. The men there stepped out onto the mold. Respondent agreed that these men should tie off so the citation was amended to charge a violation of 29 CFR $1910.132(a) and settled. (Tr. 154-156).

Mr. Eagan agrees with Mr. Choinski about the danger of using the belts and the injuries likely. Worse yet, if the platform is torn away by a runaway train with a man tied off, he could be crushed. Here, as it is now operated, the hazard is very low because the men are holding onto the vacuum's bar and could not fall (Tr. 159). He doesn't believe that respondent is in any violation for this standard does not apply so there is no reason to apply for a variance (Tr. 159-160).

David C. Tanner is an engineer in respondent's Technology Department and before that was the General Foreman in the mold yard from 1978 to 1980 (Tr. 136). A mold measures 90 inches or 7.5 feet. A man is unlikely to fall because he is braced against the 21.5 inch rail placed at that height at the employees' request and the vacuum tube practically closes off the opening (Tr. 144). He, too, agrees with Mr. Choinski about the severity of injuries if the mold were to move with a man suspended in it (Tr. 145).

Officer Wagner was recalled and testified that some injuries can be expected when a fall is stopped by the snap at the end of a safety belt's lanyard, but these would be minor compared to a man falling 10 to 12 feet on his head (Tr. 179).

Based on this testimony, I find that the use of safety belts on the no. 2 mold platform would more likely increase the chance of serious physical harm than would working without them. The belts themselves have no affect on the fall hazard. It is their affect on what happens after a man falls that must determine whether they should be used.

Tied off, a fallen man would be trapped inside of or between molds. If the molds were to move improperly -- and this has been known to happen -- he could be crushed or smashed against a mold. This could also happen if the moving molds tore away the platform with an employee tied-off and here I accept Mr. Choinski's

testimony that a man may not be able to unhook in time. Without the belts, a man would be where he fell or he could escape an endangered platform. In other words, the injuries a man might sustain as testified to by Mr. Choinski and respondent's witnesses would be worse than those suffered when a belt and lanyard stop a fall. Even if nothing untoward happened, the result of a fall of eight feet without a belt may well be no worse than a fall with the belt since the mold is only 30 inches square so that a man would suffer injuries against the sides on the way down. But, I find that the belt could cause death if the wrong event occurs at the wrong time. Cf., Ed Cheff d/b/a Ed Cheff Logging, 81 OSAHRC 60/A2, 9 BNA OSHC 1883, CCH ¶23211.

To prove the so-called "greater hazard" affirmative defense, a respondent must show[4/] (1) that compliance with the standard[5/] would diminish rather than enhance employee safety and this aspect has been shown above; and (2) that alternative means of protecting employees are either unavailable or are being used and this respondent has not shown. The employee representative has made several suggestions for limiting those parts of the job function which expose employees to the hazard but respondent has not refuted or even acknowledged these. And this is its burden.

The third aspect of this defense is a showing that a variance from the standard, 29 U.S.C. §655(d), would be inappropriate. Here, respondent argues that 29 CFR §1910.23(c)(1) does not apply to this platform. The cut-out section of the platform is more in the nature of a floor hold than an "open-sided floor or platform..." (Respondent's brief, pps. 20-23). But this standard applies

---

4/ Marion Power Shovel Co., 80 OSAHRC 110/A2, 8 BNA OSHC 224, CCH ¶24,915.

5/ Which all parties concede is impossible.

on its face[6/] and beyond those few words quoted by respondent. The guarding is required "on all open sides..." and is not restricted to the normal four sides. A respondent may not create open sides on a platform, -- that is, increase its perimeter — four feet above ground as was done here with this seven-sided platform and then claim that anything but the original four must be something other than an open side. Cf., Donovan v. Anheuser-Busch, Inc., 666 F2d 315 (1981) at 327. I conclude that the cited standard applies to this platform and respondent has not shown why a variance application, excusing literal compliance, would be inappropriate since it has not examined alternate means of protecting employees. Cf., General Electric Co. v. Secretary of Labor, 576 F2d 558 (1978).

Because the affirmative defense of "greater hazard" has not been proven in all of its elements, I conclude that respondent has not complied with the standard and this citation should be affirmed but not as issued, i.e., a repeat violation. The prior citation which forms the basis for this characterization (Exs. C-6 and C-7) covered no. 3 mold platform and I find substantial differences between the operation there and that under consideration here. No. 3 mold platform is larger, unguarded and employees have to step off the platform onto the molds to accomplish the vacuuming. None of that is present here. The use of safety belts there was considered feasible by all parties but not so on the no. 2 platform. These differences ar abustantial and the

---

6/ The standard reads:

> (c) Protection of open-sided floors, platforms, and runways. (1) Every open-sided floor or platform 4 feet or more above adjacent floor or ground level shall be guarded by a standard railing (or the equivalent as specified in paragraph (e)(3) of this section) on all open sides except where there is entrance to a ramp, stairway, or fixed ladder.

prior final order, I conclude, does not create a basis for denominating this citation as repeated. Potlatch Corp., 79 OSAHRC 6/A2, 7 BNA OSHC 1061, CCH ¶23,294.

But should an employee fall the eight feet from the platform into a mold or onto the tracks, he could suffer serious physical harm such as there is a substantial probability of fractures. Therefore, the violation is serious. 29 U.S.C. §666(j). But the likelihood of an accident is very small. I find that the employees brace themselves against the 21.5 inch rail around the cut-out section and hold on to the vacuum pipe's bar when bending over and vacuuming and that when the pipe is in the mold, it practically fills it. Further, there has been no instance of a fall which again detracts from the potential. Likelihood of an accident is a facet of a violation's gravity and I conclude that the complainant's proposed civil penalty overemphasizes this aspect. While respondent's good faith may be questioned for its failure to pursue the union's suggestions, that union is still awaiting a promised response from OSHA. Although respondent bears the primary responsibility for employee safety, 29 U.S.C. §654(a) and (b), I find that it believed the work operation on the no. 2 mold platform did not expose its employees to a hazard. A minimal penalty is appropriate here. 29 U.S.C. §666(i).

The order below affirms the alleged violation as serious and a civil penalty in the amount of $50 is assessed therefor.

II] Citation No. 1, item 2, an alleged violation of 29 CFR §1910.309(a) or (b).

Officer Wagner saw a flexible cable suspended 10 feet over the floor reaching 35 to 45 feet from the Vac-al unit to the power panel board on the wall (Tr. 28-29, 33). It is shown on exhibit C-8. This line carries 440 volts (Tr. 29). It had been struck twice by a crane and severed once with a resulting explosion of sparks resembling a July Fourth celebration (Tr. 33). Certain death by

electrocution would result if an employee were struck or if the line landed on the metal no. 2 mold platform (Tr. 33, 36, 38). The line should be imbedded in the concrete floor (Tr. 33-34); the condition was obvious and the $700 proposed penalty reflects the gravity (Tr. 39). He was told that the Vac-al unit was moved several times but this condition has existed for some four months (Tr. 34). If the line were shut down on severance by a fail-safe system, he would not have recommended the citation be issued (Tr. 50, 68-69).

Robert Horvath is a C and D[7/] mold man at the facility and pursues safety problems for Local 2601 until cured (Tr. 71-72). The Vac-al was moved many times before permanently set during the winter of 1979. Then the cable system was installed under the platform to the power panel. It took about three months after the unit's final placement and at first the flexible cable was along the floor. An assistant superintendent had it removed and suspended 10 feet. If the line is severed, a fuse would be "kicked out" of operation. (Tr. 73-77).

Mr. Eagan testified that installing the Vac-al was a construction project. Tests, such as noise studies, were conducted, before the unit's final position was determined (Tr. 102-103). David Tanner, an engineer in respondent's Technology Department, detailed this placement process and construction (Tr. 137-143) and it wasn't until May or June 1979 that the final site was found, the unit placed, and the construction completed with the cable installed (Tr. 142-143).

Mr. Eagan referred to the cable not as flexible cord but as temporary wiring during a construction process (Tr. 104). It had been knocked down twice

---

7/ Although employed for 27 years, the witness did not know what C and D represents (Tr. 71-72).

with an instantaneous shut off at the power panel occurring in milliseconds (Tr. 114, 117). It presented no hazard (Tr. 114-115) and the sparking indicates that the line was faulting out (Tr. 118) as soon as the crane touched the conductor.

I find that the suspended cable was not flexible cord used as a substitute for fixed wiring as charged originally in the citation, 29 CFR §1910.309(a)[8/], referring to the National Electrical Code (1971), section 400-4. Rather, the evidence shows that it was temporary wiring permitted under 29 CFR §1910.309(b)[9/] with reference to the National Electrical Code, section 305-1(a) which states:

> (a) Temporary electrical power and lighting installations may be used during the period of construction, remodeling, or demolition of buildings, structures, equipment, or similar activities.

Complainant argues that the process was not construction but rather "experimental or development work" for which temporary wiring may be used for only 90 days under the National Electrical Code, section 305(1)(b)[10/]. Construction is defined as "work for construction, alteration, and/or repair". 29 CFR §1910.12.

I find that the main purpose of the total process was the installation of the Vac-al unit and some trial and error (or as complainant would have it, experiment and development) was necessary to determine the most efficacious

---

8/ Since recodified in 29 CFR §1910.305(g)(iii)(A). See 46 FR 4056, Jan. 16, 1981.

9/ Since recodified in substance by 29 CFR §1910.305(a)(2)(i)(A). See 46 FR 4056, Jan. 16, 1981.

10/ This limitation was removed in the recodified standard. See 29 CFR §1910.305 (a)(2)(i)(B).

location. Respondent was not developing any new process. The platform was remodeled and altered to accomodate the unit as it was finally placed and, upon completion, the temporary wiring was removed and emplaced. I conclude that 29 CFR §1910.309(a) does not apply to this process; 29 CFR §1910.309(b), pleaded in the alternative, does and respondent was in compliance with that section. Otherwise, if respondent is found to be in violation of either section, it would have to be deemed as de minimis since no hazard existed because the power, on severance of the line, would be immediately shut down. This item is vacated in the order below.

ORDER:

In reaching the above findings and conclusions, I have considered the parties' proposed findings and conclusions in their briefs and the respondent's motion to dismiss. To the extent shown, these are adopted. Otherwise, they are rejected as not supported by either the fact or the law. Based on those findings and conclusions, it is ORDERED that:

(1) The citation No. 1, item 2, alleging a serious violation of 29 CFR §1910.309(a) or, in the alternative, 309(b), is vacated together with the civil penalty of $700 proposed therefor; and

(2) Citation No. 2 alleging a repeated violation of 29 CFR §1910.23(c)(1) is affirmed as a serious violation and a civil penalty of $50 is assessed therefor.

In accordance with the parties stipulations and motions presented at the outset of the hearing (Tr. 5-7), the following is entered:

(1) Citation No. 1, item 1, and citation 3 are vacated together with any proposed penalty on complainant's motion:

(2) Citation No. 1, item 3, is affirmed as a non-serious violation of

29 CFR §1910.95(b)(3) with no penalty assessed on complainant's motion to amend its charaterization as serious and respondent's motion to withdraw its notice of contest.

## NOTICE OF DECISION

Secretary of Labor v. John Luther and Sons Co., Inc.
OSHRC Docket No. 81-228

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 23, 1982, and will become the final order of the Commission on September 22, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 22, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

OSHRC FORM 97

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>JOHN LUTHER AND SONS CO., INC.,<br>Respondent | OSHRC DOCKET NO. 81-228<br><br>DECISION AND ORDER |

APPEARANCES:

For complainant,
Francis V. LaRuffa, Regional Solicitor
U.S. Department of Labor
New York, New York
By: Ronnie Gardstein, Atty.

For respondent,
Arnold Cirman, Safety Director
John Luther and Sons Co., Inc.,
Rochester, New York

Robert Szymanski, a compliance officer with the Occupational Safety and Health Administration of the U.S. Department of Labor (OSHA or complainant), during the course of his inspection on December 19, 1980, of a multi-story building located at Stillson and East Main Streets, Rochester, New York, which was being gutted in preparation for renovation saw two employees of John Luther and Sons Co., Inc., (respondent) working at an open elevator shaft on the fourth floor (Tr.[1/] 8-13). These employees were between the guardrail

---

1/ Tr. indicates reference to pages of the transcript.

around the shaft and the shaft itself, one removing cement with a chipping hammer about two feet from the open shaft and the other working on a perpendicular portion of the shaft (Tr. 13, 33).

No precuations had been taken to prevent a fall into the shaft -- measuring about seven by seven feet -- and a drop of nine and a half feet onto a catch platform at the third floor (Tr. 13, 16, 19). If this occurred, fractures, lacerations and concussions could result (Tr. 21). Or a man might roll off this platform which was about the size of the shaft and raised three or four feet above the third floor level and fall all the way to the building's basement (Tr. 16-18).

The men worked in this area about 20 minutes as the job of removing the cement would not take long (Tr. 27) and would come up to the edge of the shaft in the course of this work (Tr. 15); their foreman and superintendent were at the site and the placement of the guardrails around the shaft indicated respondent's knowledge of the hazard of working near the open shaft (Tr. 20).

These employees, according to the officer, should have been wearing safety belts with lanyards attached to the building columns (Tr. 19). He discussed these circumstances with respondent's superintendent, Mr. Prossick, (Tr. 11) who then told the men to put safety belts on and they did (Tr. 23).

As a result of this inspection a citation was issued[2/] on January 5, 1981, alleging that respondent seriously[3/] violated the safety standard at 29 CFR §1926.28(a) stating that

---

2/ Under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§651, et seq., citations are issued after inspections are conducted, 29 U.S.C. §658(a), and OSHA believes a standard has been violated, 29 U.S.C. §658(a). Civil penalties may be proposed under 29 U.S.C. §659(a).

3/ A serious violation is one where there is a substantial probability that death or serious physical harm could result, 29 U.S.C. §666(j).

> The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions...

A gross civil penalty of $600 was proposed. This was reduced by allowing respondent 30 percent for its good faith, 10 percent for its history, and 20 percent for its size, it has eight or nine employees in all (Tr. 14), resulting in a net civil penalty of $240 (Tr. 22).

Respondent contested[4/] this citation and penalty by letter dated January 15, 1981. It was represented by Arnold Cirman, its Safety Director for the past 11 years (Tr. 34) who was its sole witness. He testified that safety harnesses were located on the building's first floor but, since the chipping was only a 15 minute job, the men didn't want to go down and one felt the belt would be an encumberance. The floor they were working on was solid and there was little danger of a fall. (Tr. 35). Mr. Cirman did not know if the superintendent required the men to wear safety belts, but these are worn generally in the building when it is being gutted. The men will wear the belts when they feel it is necessary; it is left to each employee's discretion (Tr. 41-42). At the elevator shaft opening, the belts could have been tied off to the temporary shoring (Tr. 46).

The two men seen by the compliance officer were enlarging the shaft being prepared for a new and bigger elevator. It was to be nine feet long and 21 feet wide. They had begun at the sixth floor. One employee would be between two and three feet of the open shaft's nine foot side and the other farther away. In some cases, the cement would fall away when the underplanking was cut from beneath. Otherwise it would have to be chipped. (Tr. 36-37).

---

4/ Contests must be made within 15 working-days of receipt of the citation and penalty assessment, 29 U.S.C. §659(a) and thereafter a respondent is afforded an opportunity for a hearing, 29 U.S.C. §659(a).

Based on this evidence and after consideration of the parties' closing arguments (Tr. 43-48) where respondent maintains that little danger of a fall existed; that the employees were aware of their situation; that safety belts were available; and that if it were truly a serious violation, the compliance officer should have halted the operation, I find:

(1) An employee chipping cement within two to three feet of an open shaft was exposed to the hazard of tripping or falling into it, and

(1a) If he did, he would fall nine and a half feet and could suffer serious physical harm. If he were to roll off of that catch platform and fall to the basement, he could be killed. Respondent knew of the existence of these hazards.

(2) Respondent does not have a safety program requiring the use of safety belts when employees are exposed to this danger but rather leaves their use to an employee's choice.

The Act requires compliance by employers with the safety standards, 29 U.S.C. §654(a)(2), and the safety standard cited against the respondent here specifically places upon it the responsibility of insuring the use of protective devices when its employees are faced with hazardous conditions. Respondent has failed in this requirement and the citation must be affirmed[5/] against it. The proposed penalty appropriately accounts for the gravity of the violation including the likelihood of a fall which, although not great, could happen, respondent's size, history and good faith; and this penalty should be affirmed. 29 U.S.C. §666(i).

---

5/ Respondent, in its answer and at the hearing (Tr. 5), admitted that it is an employer having employees and affecting interstate commerce. The Commission's jurisdiction is proper. 29 U.S.C. §§652(5) and 653(a).

It is ordered[6/] that the citation issued January 5, 1981, alleging a serious violation of 29 CFR §1926.28(a) together with the civil penalty of $240 be affirmed.

DAVID J. KNIGHT
JUDGE, OSHRC

Terence G. Connor, Esquire, Morgan, Lewis & Bockius, Miami, Florida, on behalf of respondent.

## DECISION AND ORDER

Burroughs, Judge: Construct Erectors, Inc., seeks relief from the finality of a repeated citation issued to it on November 5, 1981, and asks that the Commission entertain a late-filed notice of contest. The repeated citation alleged a violation of 29 C.F.R. § 1926.28(a) and proposed a penalty of $1,280 for the alleged violation.

As a result of an inspection conducted in October, 1981, at a work site located in Juno Beach, Florida, respondent was issued a serious citation and a repeated citation. The parties have stipulated that the citations were issued on November 5, 1981, and received by respondent on November 9, 1981 (Tr. 3-4). The parties are also in agreement that a meeting occurred on November 18, 1981, between James Aubke,

respondent's president, David Norris, acting area director of the Fort Lauderdale OSHA office at the time of the meeting, and Joseph DiMartino, the inspecting compliance officer, and that an informal settlement agreement was concluded by Aubke and Norris at the meeting and a written agreement was executed by them on the same date (Ex. C; Tr. 4-5).

On December 14, 1981,[1/] the Prestressed Concrete Institute issued a newsletter advising its members of the decision of the Court of Appeals for the Fifth Circuit in S & H Riggers and Erectors v. OSHRC, 659 F.2d 1273 (5th Cir. 1981), wherein the court held the Secretary bears the burden of proving either that the employer failed to provide personal protective equipment to its employees under which it is the general practice in the industry to do so or that the employer had actual knowledge that personal protective equipment was necessary under the circumstances. Aubke received a copy of the newsletter from another contractor some time within the month after its publication (Tr. 37-39). After reading the newsletter, Aubke telephoned Norris on January 5, 1982, and complained that the settlement was not fair since the fifth circuit had, in his opinion, held that safety belts were not applicable to the facts of his case (Tr. 38, 41, 106-107). According to Aubke, he was told by Norris that the case was bad law (Tr. 38).

---

1/ The record does not indicate the exact date the newsletter was issued (Tr. 37-38). Respondent's brief uses the date of December 14, 1981, and this date is accepted since it is consistent with the time period testified to by the witnesses. Aubke talked with Norris again after reading the newsletter (Tr. 37-38, 39-40, 41), and Norris testified that the conversation took place on January 5, 1982 (Tr. 106-108). Aubke testified that he could not deny that the conversation took place on that date (Tr. 48). The January 5, 1982, date would appear reasonably correct since Aubke testified that he talked with his attorney about the matter within a week or so of talking with Norris (Tr. 40, 43). The attorney wrote a letter to Norris which was dated January 14, 1982 (Tr. 4).

Sometime after talking with Norris about the unfairness of the settlement, Aubke mentioned the matter to his attorney. On January 14, 1982, his attorney wrote the following letter to Norris:

> I am the attorney for Con-Struct Erectors, Inc. Mike Aubke, the president of the company was to my office the other day wherein he advised me that an action was implemented by your office with regard to the requirement of his employees to wear safety belts. I understand that that matter was handled wherein my client paid a penalty of some fifteen hundred dollars and change. Subsequent to that we received notice of the court ruling by the U.S. Circuit Court of Appeals, Fifth Circuit, that Ironworkers are not required to wear safety belts. To add insult to injury it has now been acknowledged that your district office knew of this ruling before taking on the action and certainly before the settlement of the case which under these circumstances, we think was in bad faith. We respectfully request your reconsideration of what has transpired and would ask for you to consider refunding the money that was paid under these circumstances. Your immediate attention to this matter will be most appreciated.

The parties stipulated that the letter of January 14, 1982, was the only notice of contest filed by respondent concerning any part of the November 5, 1981, citations (Tr. 4).

On February 8, 1982, a motion to dismiss notice of contest was filed by the Secretary on the grounds that the notice was untimely and because the matter in dispute had previously been resolved by an amicable settlement between the parties. Since the letter of January 14, 1982, raised the spectre of bad faith or misrepresentation on the part of the Secretary, the motion was denied by order dated March 16, 1982, without prejudice to renew, in order to allow respondent an opportunity to present evidence for relief under Rule 60(b) of the Federal Rules of Civil Procedure, as made applicable to Commission proceedings by Branciforte Builders, Inc., 81 OSAHRC 80/A5, 9 BNA OSHC 2113, 1981 CCH OSHD ¶ 25,076 (No. 80-1920, 1981). A hearing was held for this purpose on May 14, 1982.

The settlement agreement covered the serious and repeated citations issued to respondent on November 5, 1981. Under the terms of settlement, respondent agreed to the violations set forth in the citations, and the Secretary agreed to reduce the penalty for the repeated violation from $1,280 to $880 (Ex. C). Respondent seeks to void the terms of settlement and requests that the letter dated January 14, 1982, from its attorney, be treated as a notice of contest to the repeated citation.

In order for the Commission to have jurisdiction, a timely notice of contest must be filed. Service Specialty, Inc., 80 OSAHRC 16/A9, 7 BNA OSHC 1770, 1979 CCH OSHD ¶ 23,928 (No. 16033, 1979). Section 10(a) of the Act, 29 U.S.C. § 659(a), gives an employer 15 working days from the receipt of a citation within which to notify the Secretary of Labor that he intends to contest the citation. The Commission's docketing of a case and its subsequent assignment to a judge does not constitute a waiver of the 15-day contest period. The Commission merely provides a forum in which the timeliness of the notice of contest may be adjudicated. Branciforte Builders, Inc., supra.

Under certain circumstances, a late notice of contest is considered timely. The Commission has held that an employer's failure to contest a citation within the 15-day period was excused when the delay in filing was caused by the Secretary's deception or failure to follow proper procedures. B. J. Hughes, Inc., 79 OSAHRC 49/E6, 7 BNA OSHC 1471, 1979 CCH OSHD ¶ 23,675 (No. 76-2165, 1979). The Commission's holding in B. J. Hughes, supra, was implicitly grounded on the equitable principles of Rule 60(b) of the Federal Rules of Civil Procedure even though in Plessey, Inc., 74 OSAHRC 77/C1, 2 BNA OSHC 1302, 1974-75 CCH OSHD ¶ 18,907 (No. 946, 1974), the Commission held it could not grant relief under Rule

60(b) to modify a citation and penalty that became final because a timely notice of contest was not filed. This is made clear by the Commission's holding in Branciforte Builders, Inc., supra, wherein it concluded that section 10(a) of the Act does not in all cases present an impenetrable barrier to Commission jurisdiction over a citation when the notice of contest is untimely. Following the rationale of Branciforte Builders, Inc., supra, an employer filing a late notice of contest may be granted relief if one or more of the provisions of Rule 60(b) of the Federal Rules of Civil Procedure are applicable.

Rule 60(b) states six reasons upon which a motion to relieve a party from a final judgment may be granted.[2/] Respondent's arguments fall under subsections (1), (3) or (6) of Rule 60(b). Rule 60(b)(1) provides relief from a final judgment or order when it is shown that the final judgment or order was entered because of "mistake, inadvertence, surprise, or excusable neglect." Under Rule 60(b)(3) a final judgment may be vacated when it is shown that it occurred because of " fraud . . . , misrepresentation, or other misconduct of an adverse party." Rule 60(b)(6) is the residual clause and provides that a final judgment may be vacated for "any other reason justifying relief from the operation of the judgment."

---

2/ Rule 60(b), Federal Rules of Civil Procedure, sets forth the following reasons to relieve a party from a final judgment:

> On motion and upon such terms as are just, the court may relieve a party or his legal representative from a final judgment, order, or proceeding for the following reasons: (1) mistake, inadvertence, surprise, or excusable neglect; (2) newly discovered evidence which by due diligence could not have been discovered in time to move for a new trial under Rule 59(b); (3) fraud (whether heretofore denominated intrinsic or extrinsic), misrepresentation, or other misconduct of an adverse party; (4) the judgment is void; (5) the judgment has been satisfied, released, or discharged, or a prior judgment upon which it is based has been reversed or otherwise vacated, or it is no longer equitable that the judgment should have prospective application; or (6) any other reason justifying relief from the operation of the judgment.

Respondent's primary contention is that the settlement of the issue involving 29 C.F.R. § 1926.28(a) is contrary to the law as established by the fifth circuit in S & H Riggers, Inc., supra, that the settlement is inequitable, and that justice demands that respondent have relief from the settlement. It asserts:

> In this case the Area Director misled Respondent's President, a lay person, by falsely representing to him that there was a violation of the Act and refusing to consider dismissal or vacation of the citation, thus leading him to believe that respondent had no defense to the citation. (Respondent's brief, p. 10).

There is no evidence of any deception or improper conduct on the part of Norris or any other representative of the Secretary. The evidence does not support the conclusion that Aubke entered into the settlement agreement through inadvertence, surprise, mistake or excusable neglect (Rule 60(b)(1)), or fraud, misrepresentation, or misconduct of an adverse party (Rule 60(b)(1)). There is also no evidence that the settlement agreement was procured under exceptional or compelling circumstances justifying relief under Rule 60(b)(6). Aubke's decision to settle was based upon a consideration of the benefits to be derived from a settlement balanced against the probable costs of litigation.

Aubke testified that to his knowledge it was not industry practice or custom to use safety belts under the circumstances which his company was cited (Tr. 33-34, 36, 39, 51). He obviously possessed his view of the industry custom at the time of the conference on November 18, 1981. When he was unable to convince Norris of the merits of respondent's case, he agreed to settle in order to reach some immediate finality to the matter. He testified (Tr. 35-36):

> Q. At the meeting, was there any discussion of the purpose or the simplicity of this settlement meeting, as opposed to contesting the action?
>
> A. Well, I think basically is the fact that, let's not get the lawyers involved in this thing; let's work it out and go on our way and not have a big, involved, long, drawn out process.

The acting area director was not respondent's attorney and had no duty to advise Aubke as to whether respondent had a defense to the action. If Aubke felt strongly about the matter, he could have contested the citations on behalf of respondent. The truth is, as conceded by Aubke, respondent did not contest the citations because of the expense involved and the small probability of success. He testified (Tr. 51-52):

> JUDGE BURROUGHS: Why did you forego your right to contest the citation in this case?
>
> THE WITNESS: Well, this was prior to the knowledge that I came about there, as far as that Fifth Circuit Court of Appeals and my previous experience — not my previous experience, but other peoples' experience in going through these contestings, with a long drawn out expensive affairs, and what the ultimate percentage of success was not very good, it seemed like.
>
> So based on that, we just felt that it was in our best interest to go ahead and, based on what we were told, and the citations issued and so forth, we felt it was in our best interest to go ahead and settle it.

Aubke's description of his meeting with Norris on November 18, 1981, does not reveal any deception or fraud on the part of Norris. Aubke testified (Tr. 34-35):

> Q. How did that meeting begin, if you recall?
>
> A. Well, I don't remember that much about it. I just remember that we talked in general about our business and about the violations.
>
> And it seemed that we came to some sort of like a — we just sort of ran out of things to talk about. There was no movement one way or the other.
>
> This is strictly just an opinion or a feeling that I had, was that we were sort of, well, let's get on into settling this thing, and then it was into the negotiations of what the fine would be reduced by. And we came to an agreement on the amounts of the money, and that was the basic.
>
> Q. Did Mr. Norris indicate to you whether your company had violated a standard that OSHA had issued?
>
> A. I don't recall the specific words. It was just that there was a citation issued and we had violated that.

Aubke further described his conference with Norris in the following manner (Tr. 52-53):

> JUDGE BURROUGHS: Well, did you do any negotiating with Mr. Norris concerning a settlement?
>
> THE WITNESS: As far as the money? The monetary value?
>
> JUDGE BURROUGHS: Well, any issue.
>
> THE WITNESS: Well, they absolutely refused to dismiss it. There was no question. They would not dismiss the charge. That was obvious from the beginning.
>
> We had a telephone conversation, I think, before this happened. Then we had this meeting, and there was no discussion about dismissing the citation, period.
>
> JUDGE BURROUGHS: Well, who suggested that the penalty be downgraded in order to dispose of the matter.
>
> THE WITNESS: My own feeling was that we came to this point where we had reached an impasse, a sort of just a lull in the conversation. And it seems to me, my recollection is that in order to get this thing moving, there was discussion about, well, what do we do now; what is the way that we settle this; how do we go about settling this.
>
> And I had never been involved in any negotiation with OSHA before. Any citation we had before, we just paid the fine and went about our way.
>
> And so my recollections of it was that it was initiated from that side, from the other side, that if the penalties were downgraded would it be acceptable to us in order to resolve the situation.

There are no facts or circumstances which show that Norris had any undue influence or practiced any fraud, deceit, or misrepresentation on Aubke, or exerted any duress in order to reach the settlement. There was no privity or fiduciary relationship between them and, contrary to respondent's contention, Norris was under no duty to advise Aubke that respondent should litigate the matter. The settlement agreement arose out of an open discussion between two parties with differing views of the applicable law. Aubke made a considered choice to settle

and not contest the citation. His choice may have been a risk, but it was deliberate and followed a free choice. Respondent cannot be relieved of its choice because hindsight seems to indicate to it that the decision to settle was probably wrong, considering the views of the court in S & H Riggers, Inc., supra. As stated in Moore's Federal Practice, 2d ed., vol. 7, ¶ 60.22(2), p. 256, and quoted in Rarick v. United Steelworkers of America, 202 F. Supp. 902, 904 (W.D. Pa., 1962):

> [G]enerally speaking a party who makes an informed choice as to a particular course of action will be not be relieved of the consequences when it subsequently develops that the choice was unfortunate.

The denial of complainant's motion would make a mockery of the doctrine of finality. Settlement agreements would have no binding affect on the parties.

Respondent's position is understandable, but no sufficient legal reason is raised whereby the late notice of contest should be accepted by the Commission. Respondent failed to fully protect its legal rights by perfecting a notice of contest. This was a voluntary and deliberate choice on the part of its president to forego litigation. He made an appraisal of the facts of respondent's case, the law as he understood it and concluded that it was in the best interest of respondent to settle the matter. The notice of contest is dismissed.

An ancillary question raised by respondent concerns the admissibility of the depositions of Jose Sanchez and David Norris which were taken on May 13, 1982, a day prior to the hearing. During a conference held on May 10, 1982,[3/] with counsel for the parties, counsel for respondent requested the opportunity to take the depositions of Jose Sanchez and David Norris. Counsel for complainant agreed to make Sanchez and Norris available on May 13, 1982, and their depositions were

---

3/ Respondent's brief refers to the conference date as May 9, 1982. This date is incorrect. The conference was held on a Monday, which was May 10, 1982.

taken on that date. The depositions were taken pursuant to Rule 53(a) of the Commission's Rules of Procedure.[4/]

At the hearing, counsel for respondent sought to introduce the transcripts of their depositions into the record as original evidence. Counsel for complainant objected since Sanchez and Norris were in attendance at the hearing and available for questioning by respondent's counsel. The objection was sustained and respondent called Sanchez and Norris as witnesses at the hearing. Respondent renews its request to have the transcripts of Sanchez and Norris accepted into the record as part of the evidence to be considered in reaching a determination in this matter.

The parties in Commission proceedings do not have an unqualified right to take depositions. Rules 53 and 70 of the Commission's Rules of Procedure set forth two types of depositions that are allowable by order of the Administrative Law Judge or the Commission. Rule 53(a) pertains to discovery depositions. Rule 70 covers situations where a party desires to take the deposition of a witness in lieu of oral testimony.[5/] The depositions of Sanchez and Norris were taken pursuant to Rule 53.

Where a party desires to take the deposition of a witness <u>in lieu of oral testimony</u>, it is clear that he must proceed under Rule 70 and not Rule 53 as was done by respondent in this case. The rules differentiate between the types of

---

4/ Rule 53(a) provides:

> Except by special order of the Commission or the Judge, discovery depositions of parties, intervenors, or witnesses, and interrogatories directed to parties, intervenors, or witnesses shall not be allowed.

5/ Commission Rule 70(a) provides, in pertinent part, as follows:

depositions and it is clear that the use of a deposition in lieu of oral testimony is not permitted in Commission proceedings unless the ALJ or Commission has previously approved the application. The purport of Rule 70 is to require oral testimony of witnesses at the hearing unless special circumstances are shown which justify their testimony being taken by deposition.

Respondent relied upon the provisions of Rule 32(a)(2) of the Federal Rules of Civil Procedure in support of admission of the depositions in lieu of oral testimony.[6/] Rule 32(a)(2) permits "a party to introduce the deposition of an

---

> An application to take the deposition of a witness in lieu of oral testimony shall be in writing and shall set forth the reasons such deposition should be taken, the name and address of the witness, the matters concerning which it is expected he will testify and the time and place proposed for the taking of the deposition, together with the name and address of the person before whom it is desired that the deposition be taken (for purposes of this section, hereinafter referred to as "the officer"). Such application shall be filed with the Commission or the Judge, as the case may be, and shall be served on all other parties and intervenors not less than 7 days (when the deposition is to be taken within the continental United States) and not less than 15 days (if the deposition is to be taken elsewhere) prior to the time when it is desired that the deposition be taken. Where good cause has been shown, the Commission or the Judge shall make and serve on the parties and intervenors an order which specifies the name of the witness whose deposition is to be taken and the time, place, and designation of the officer before whom the witness is to testify.

6/ Rule 32(a)(2) of the Federal Rules of Civil Procedure provides:

> Use of Depositions. At the trial or upon the hearing of a motion or an interlocutory proceeding, any part or all of a deposition, so far as admissible under the rules of evidence applied as though the witness were then present and testifying, may be used against any party who was present or represented at the taking of the deposition or who had reasonable notice thereof, in accordance with any of the following provisions:
>
> * * *
>
> (2) The deposition of a party or of anyone who at the time of taking the deposition was an officer, director, or managing agent, or a person designated under Rule 30(b)(6) or 31(a) to testify on behalf of a public or private corporation, partnership or association or governmental agency which is a party may be used by an adverse party for any purpose.

adversary as part of his substantive proof regardless of the adversary's availability to testify at trial." Coughlin v. Capitol Cement Co., 571 F.2d 290, 308 (5th Cir. 1978); see also Pingatore v. Montgomery Ward and Co., 415 F.2d 1138 (6th Cir. 1969), cert. den. 90 S. Ct. 1818 (1970). The deposition may be used as evidence of an admission and may be introduced as independent or original evidence by the adverse party and not merely for purposes of impeachment as provided in Rule 32(a)(1). Fey v. Walston and Co., 493 F.2d 1036 (7th Cir. 1974).

Respondent ignores the import of Rule 70 of the Commission's Rules of Procedure which supersedes Rule 32(a)(2) of the Federal Rules of Civil Procedure. Rule 2(b) of the Commission's Rules of Procedure specifically provides that the Federal Rules of Civil Procedure are not applicable where the Commission has a specific rule covering the particular situation.[7/] Rule 70 of the Commission's Rules of Procedure specifically covers depositions in lieu of oral testimony. The depositions of Sanchez and Norris were taken pursuant to Rule 53 and not Rule 70. While respondent argues that the Federal Rules do not distinguish between depositions for discovery and trial purposes, Commission Rules do make a distinction between the types of depositions. It is clear that the admissibility of depositions in lieu of oral testimony is governed by Commission Rule 70 and not Rule 32(a)(2) of the Federal Rules of Civil Procedure. A ruling admitting the depositions as original evidence would have ignored the clear intent of Rule 70 and

---

7/ Rule 2(b) of the Commission's Rules of Procedure provides:

> In the absence of a specific provision, procedure shall be in accordance with the Federal Rules of Civil Procedure.

rendered it meaningless.[8/] The depositions are not admissible pursuant to Rule 32(a)(2) of the Federal Rules of Civil Procedure.

Since Sanchez and Norris testified at the hearing, Rule 32(a)(1) of the Federal Rules of Civil Procedure would permit their depositions to be used for the purpose of contradicting or impeaching their testimony.[9/] At the conclusion of the hearing, the record was held open to allow respondent time to read the transcripts of the depositions to determine if there was any inconsistency between the depositions and their oral testimony (Tr. 129-132). The transcripts were forwarded by letter dated June 23, 1982, from respondent's counsel for inclusion into the record. Respondent alludes to inconsistency on the part of Sanchez as to instructions concerning 29 C.F.R. § 1926.28(a) from the Regional Director. It further points to alleged inconsistency on the part of Norris as to the factual support for the alleged violation prior to the elapsing of the contest period. Even if their testimony on these points was inconsistent, the inconsistencies are not relevant to the issue in dispute. The admission of the depositions for the reasons advanced by respondent would only serve to inject additional irrelevant matter into the record. Respondent's motion to admit the depositions into evidence under Rule 32(a)(1) of the Federal Rules of Civil Procedure is denied. "Useless encumberance of the record cannot be insisted upon in any case." Fey v. Walston, supra, 493 F.2d at 1046.

---

8/ If a discovery deposition taken pursuant to Rule 53 is admissible as original evidence, i.e., in lieu of oral testimony, there would never be any need to proceed under Rule 70.

9/ Rule 32(a)(1) of the Federal Rules of Civil Procedure provides:

> Any deposition may be used by any party for the purpose of contradicting or impeaching the testimony of deponent as a witness.

The Secretary asks the Commission to assess penalties in accordance with the settlement agreement which was dated November 18, 1981. Since the Commission does not have jurisdiction, the request must be denied. The parties are left to their own agreement.

## FINDINGS OF FACT

1. A serious citation and repeated citation were issued to respondent on November 5, 1981. The citations were received by respondent on November 9, 1981 (Tr. 3-4).

2. On November 18, 1981, respondent's president, James Aubke, met with David Norris, acting area director for OSHA, and Joseph DiMartino, the compliance officer who conducted the inspection, to discuss the citations (Tr. 4).

3. A settlement was concluded as a result of the meeting on November 18, 1981, and a written settlement agreement was executed by the parties on November 18, 1981 (Ex. 1; Tr. 4).

4. The only communication which could be construed as a notice of contest is a letter dated January 14, 1982, from attorney David Feldman, acting on behalf of respondent, to David Norris (Tr. 4).

## CONCLUSIONS OF LAW

1. Respondent, at all times material hereto, was engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. Respondent's notice of contest was untimely.

3. The Commission is the proper forum in which to adjudicate the timeliness of a notice of contest.

4. The failure to file a timely notice of contest was a voluntary and deliberate choice on the part of respondent's president to forego litigation in exchange for a reduction in the amount of proposed penalty.

5. Respondent is not entitled to relief pursuant to Rule 60(b) of the Federal Rules of Civil Procedure.

## ORDER

Based upon the foregoing findings of fact and conclusions of law, it is

ORDERED: That the motion to dismiss the untimely notice of contest is granted.

Dated this 24th day of August, 1982.

NOTICE OF DECISION

Secretary of Labor v. Astro, Astro Resources Corporation, Astro Ecology Corporation (in the alternative)
OSHRC Docket No. 81-1348

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 25, 1982, and will become the final order of the Commission on September 24, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 24, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

|---|---|---|
| SECRETARY OF LABOR, Complainant, | : | |
| | : | |
| v. | : | OSHRC Docket No. 81-1348 |
| ASTRO, ASTRO RESOURCES CORPORATION, ASTRO ECOLOGY CORPORATION, (in the alternative) Respondent. | : | |

Appearances:

Jordana W. Wilson, Esquire, for the Complainant.

John W. Small, Non-attorney, for the Respondent.

DECISION AND ORDER

This is a proceeding under Section 10(c) of the Occupational Safety and Health act of 1970. After inspection by a compliance officer the respondent was issued a serious citation and a non-serious citation for alleged violations of the safety standards promulgated under the Act. A notice of contest having been entered by the respondent, the matter went to hearing on March 23, 1982 at Houston, Texas.

Citation No. 1 alleges two serious violations of the Act in that the safety standards at 29 CFR 1910.215(a)(2) and (a)(4) were violated. The first alleges that "abrasive wheel(s) used on grinding machinery were not provided with safety guard(s) which covered the spindle end, nut, flange projection: (a) Craftsman 1/3 horsepower bench grinder, located in the shipping room, did not have a safety guard." The second alleges that "grinding machinery was not used with work rest(s) to support off-hand grinding work: (a) Craftsman 1/3 horsepower bench grinder, [above] did not have a tool rest." A proposed penalty of $120.00 was issued in this citation.

Citation No. 2 alleges that the regulations at 29 CFR 1903.2(a)(1) and 29 CFR 1904.2(a) were violated in that the respondent failed to post the OSHA notice for the benefit of its employees, and because a log of all recordable occupational injuries and illnesses was not maintained. No penalties were proposed in this citation.

## The Relevant Testimony

Mr. John Small, called as an adverse witness by the Complainant, stated that the respondent's business is at 801 Link Road, League City, Texas. He owns several companies, and generally is the president of the companies. (Tr. 1-15). Some of the companies are not operational. It appears that Astro Ecology, incorporated in 1971, was the lead company. It was formed for the purpose of manufacturing a water quality monitor. (Tr. 16-17). The witness personally owns the buildings and land at 801 Link Road. (Tr. 18). At times other companies are permitted to perform certain work at 801 Link Road. (Tr. 19). The witness was president of Astro Ecology until a short time before the hearing. (Tr. 23). He has been president of Astro Resources Corporation since prior to the inspection

which resulted in the citations here considered. (Tr. 24-25). The products manufactured by the last-named corporation were shipped to buyers within and without Texas. (Tr. 25). The company employed about 12 or 15 employees in 1981, and presently employs about 35. (Tr. 26).

Philip LaPoma, employed by Lico Incorporated, supervised employees of Astro Resources in May 1981 (the time of the inspection). Lico was paid for the supervisory work performed by the witness. (Tr. 27-28). He recalled the inspection and having conversed with the compliance officer for OSHA at that time. (Tr. 29-30). The grinder shown in exhibit C-2 was the one concerned at the time of the inspection. (Tr. 31). He recalled the inspector mentioning the absence of a side safety guard and a tool rest. (Tr. 32). It was used about once or twice a week, not with any regularity. (Tr. 33). Different employees used it.

David Sapp has worked for Astro Resources since October 1979. He recalled the inspection by the compliance officer in May 1981. At that time his supervisor was Mr. Small. (Tr. 36). He was production manager at the time. He had used the cited grinder prior to the inspection. He was not aware that the grinder required a side guard. (Tr. 36-37).

Edward Solter, compliance officer for the OSHA, testified that he had had 3 years' experience with the federal government in that agency. He had had prior experience in the field of safety, and also had worked as a machine operator at one time. (Tr. 39). He stated that he conducted a general schedule inspection of the respondent's workplace on May 7, 1981. He held an opening conference with Mr. LaPoma, who identified himself as a vice-president of Astro Ecology. (Tr. 42-43).

The compliance officer further testified that he inspected the bench grinder (Ex. C-2)and found that it lacked a tool rest and a side guard. (Tr. 45). The missing elements constituted a hazard to the employees using the grinder because a disintegrating grinding wheel could fly out of the unit with great force from either angle left unprotected. (Tr. 46). The two other violations noted were the absence of the OSHA notice to employees and the log of injuries. (Tr. 48).

The grinder may have had some fixed device which was to have acted as a form of tool rest, but the normal type of tool rest for that type of grinder was not bolted into the slot provided for it. (Tr. 56).

Mr. LaPoma, testifying for the respondent, stated that the cited grinder (Ex. C-2) was equipped with one tool rest at the time of the inspection, but that it was not properly adjusted. (Tr. 58).

Mr. Small, sworn as a witness, made a statement in support of his position. He stated that neither Astro Ecology nor Astro Resources owns the grinder in exhibit C-2, and that it is his personal property. It is used, however, by his companies and by other companies with which he has no connection. (Tr. 61). He further stated that he was not contesting that there was a violation with respect to [the grinder]. (Tr. 62). He does object to bringing Astro Resources Corporation into the litigation.

The motion to amend the complaint to name Astro Resources Corporation had been previously granted. The respondent's motion to dismiss the motion was taken under advisement. No prejudice having been shown, the motion to dismiss is denied.

Ownership of the bench grinder is not essential to the findings in this matter, it appearing quite clearly that the machine was under the control of Astro Resources Corporation at that time of the inspection. It had been used for some time in the work of the company, although it was not in regular use, say on a daily basis. The irregular and infrequent use of the grinder in the condition noted by the compliance officer would tend to lessen the exposure of employees to the hazard presented, and this, in turn, impels me to believe that the $120 penalty proposed was somewhat excessive. The violation was a serious one within the meaning of the Act, however, in view of the type and nature of the physical injuries that could have been sustained by employees because of the missing elements. Considering all factors, I find that a penalty of $50 would be proper for the violations in Citation No. 1.

It is, therefore, ORDERED that:

For the violations found in Citation No. 1 (serious) the respondent Astro Resources Corporation is assessed a penalty of $50.00.

For the violations found in Citation No. 2 (non-serious), no penalty will be assessed.

The citations are affirmed as shown.

## NOTICE OF DECISION

Secretary of Labor v. Arute Brothers, Inc.
OSHRC Docket No. 81-2766

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 5, 1982, and will become the final order of the Commission on September 24, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 24, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

| v. | : | OSHRC DOCKET NO. 81-2766 |
| ARUTE BROTHERS, INC., | : | |
| Respondent | : | |

Appearances:

Robert J. Murphy, Esq., for Complainant

Charles M. Fox, Esq., for Respondent

DECISION AND ORDER

Respondent, Arute Brothers, Inc. (Arute), was cited for seriously violating the Occupational Safety and Health Act of 1970 (the Act) by failing to comply with the personal protective equipment standard, 29 C.F.R. §1926.28(a), which reads as follows:

> The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

The Secretary has proposed that Arute be assessed a penalty of $240 for the alleged violation.[1/] Arute contested the matter, and a hearing was held on May 12, 1982.[2/]

1/ The parties stipulated that the $240 penalty proposed by the Secretary is appropriate should the citation be affirmed (Tr. 3).

2/ Arute was also cited for nonserious violations of various other construction safety standards. These were not contested by Arute.

On the day of the OSHA inspection on November 5, 1981, Arute was engaged in the construction of a road and an overpass bridge in Trumbull, Connecticut. At the time of the inspection, the compliance officer observed several of Arute's employees in the process of installing wood planking along the bridge's horizontal beams. The employees walked along the top of the 16-inch-wide upper flanges of the I-beams, which were spaced 8 feet apart. The employees also stood on wood planking interspaced along the lower flanges of the I-beams. The height of the beams varied from 16 feet to 22 feet. At the time of the inspection, there was no vehicular traffic or construction vehicles passing under the bridge. The employees were not provided with any form of fall protection (Tr. 13-20, Exhs. C-2, C-37). These facts are not disputed. Arute contends that it cannot be held in violation of the personal protective equipment standard because its methods conformed to the customary conduct of other construction companies in Connecticut.

According to the testimony of Arute's vice president, Adrian Tyler, Arute's policy was not to provide fall protection for its employees working on bridges unless the potential fall distance was at least 25 feet (Tr. 30-31). Tyler testified that Arute's 25-foot fall-protection policy was the same as that followed by other construction firms in Connecticut (Tr. 33). In an effort to buttress Tyler's testimony regarding industry practice, Arute called Thomas Defonse and Albert Brunalli, both of whom are presidents of construction firms based in Connecticut, and each of whom has over 40 years of experience in construction work including the building of bridges.

But their testimony falls far short of supporting Arute's industry practice argument. Defonse testified that it was the custom among bridge builders to provide safety measures only where the potential fall distance

reached the level of 50 feet (Tr. 41-42, 46-47). Brunalli testified that his construction firm did not provide fall protection for employees working on bridges with a drop of less than 25 feet except in "unusual circumstances," such as working above railroad tracks where the danger of passing trains is present (Tr. 51, 53). When questioned by Arute's counsel as to what the common practice was among construction firms in Connecticut, Brunalli's testimony was vague (Tr. 53). And on cross-examination he testified that he would not provide fall protection even where the potential fall distance was 26 feet, and that where the fall distance was 30 feet, "[c]hances are we would have it" (Tr. 56).

If there is a customary precautionary measure taken by bridge builders in Connecticut to guard against fall hazards, it is not discernible from the witnesses presented by Arute. In any event, compliance with customary procedures in the construction industry is not, by itself, determinative of the issue. According to Commission precedent, the test to be applied is whether a reasonable person familiar with the factual circumstances surrounding the allegedly hazardous condition, including any facts unique to a particular industry, would recognize a hazard warranting the use of personal protective equipment. Bethlehem Steel Corporation, 10 BNA OSHC 1264, 81 CCH OSHD ¶25,839 (No. 16067, Dec. 31, 1981). The Commission's "reasonable person" test has been endorsed by a number of Circuit Courts dealing with the general provisions of either 1926.28(a) or 1910.132, the analogous general industry standard: Southern Ohio Building Systems, Inc. v. OSHRC, 649 F.2d 456, 460 (6th Cir. 1981); Voegele Co., Inc. v. OSHRC, 625 F.2d 1075, 1077-1079 (3rd Cir. 1980); Bristol Steel & Iron Works, Inc. v. OSHRC, 601 F.2d 717, 722-724 (4th Cir. 1979); American Airlines, Inc. v. Secretary of Labor, 578 F.2d 38, 41 (2d Cir. 1978); Brennan v. Smoke-Craft, Inc., 530 F.2d 843, 845 (9th Cir. 1976); Arkansas-Best Freight Systems, Inc. v. OSHRC, 529 F.2d 649, 655 (8th Cir. 1976); and

Cape & Vineyard Division of New Bedford Gas v. OSHRC, 512 F.2d 1148, 1152 (1st Cir. 1975). Only the Fifth Circuit Court has limited the reasonble person test to the custom and practice of the industry rather than evaluating customary industry practice as only one aspect of the reasonable person test. S & H Riggers & Erectors, Inc. v. OSHRC, 659 F.2d 1273 (5th Cir. 1981).

Arute contends that recognition of a fall hazard depends on not only the consequences of a potential fall but also the likelihood of such a fall under the cited working conditions. No support for this contention can be found in the Voegele case, supra, as Arute maintains. In Voegele, the allegedly hazardous condition involved a roof varying in height from 14 to 35 feet, with the major portion of the roof being essentially flat, sloping 2-3 degrees downward from the center for drainage. The court stated:

> The citation in this case issued for a serious violation because the only serious hazard that could occur from the violative condition was falling from the roof to the concrete ground. Obviously, such a fall would result in death or serious harm within the meaning of OSHA's definition of "serious." See 29 U.S.C. §666(j) (1976) [footnote omitted]. The Secretary of Labor argues that since the only likely harm is of a serious nature, there is an obvious recognizable hazard. But this does not answer Voegele's contention concerning the probability of occurrence of this extreme harm in the context of a flat roof. Because substantial evidence suggests that this roof was not an ordinary flat roof, however, we hold that where no protective equipment was provided and where there was a risk of serious injury, there was an obvious hazard.[11]

* * *

11...Jensen Const. v. OSHRC, 597 F.2d 246, 249 (10th Cir. 1979) (obvious falling hazard under §1920.28(a) where employee worked 17-23 feet above ground and astride structural beams with no protective equipment); Usery v. Marquette Cement Mfg. Co., 568 F.2d 902, 909 (2d Cir. 1977) (general duty clause).

625 F.2d at 1079-1080. As can be seen, the court did not regard the question of "probability of occurrence" or likelihood of injury to be a significant factor. Indeed, in the Jensen case referred to by the court in its footnote 11, the facts are remarkably parallel to those in the instant case. In its brief (p. 12), Arute argues that a "crucial" distinction between Jensen and the instant case exists: in the Jensen case, employees worked "above a heavily travelled highway and a fall from even a low clearance bridge in such case could result in serious physical harm due to the possibility of being hit by vehicular traffic below," a condition not present here. This argument is unpersuasive. There is nothing in the Jensen decision to suggest that vehicular traffic was the pivotal factor in upholding a "serious" citation for failure to provide protection against a 17-23-foot fall hazard. The absence of moving vehicles does not eliminate the danger of sustaining serious injury if an employee were to fall from the same height onto either a finished highway or, as here, a "rough graded" roadway. Arute's own witnesses conceded that its employees could have sustained serious physical injuries if they had fallen from their work stations shown in the photographic evidence (Tr. 34, 43-44, 56-57).

Section 17(k) of the Act, 29 U.S.C. §666(k), provides:

> [A] serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

The Secretary need not prove substantial probability of an accident in order to establish a serious violation. A serious violation is established if there is a possibility of an accident which, if it occurs, would have a substantial

probability of resulting in death or serious physical harm. Portland Stevedoring Co., 1 BNA OSHC 1250, 1973 CCH OSHD ¶15,052 (No. 5, July 1973). What the Ninth Circuit Court said in California Stevedore & Ballast Co. v. OSHRC, 517 F.2d 986, 988 (9th Cir. 1975), is equally applicable here:

> Where violation of a regulation renders an accident resulting in death or serious injury possible, however, even if not probable, Congress could not have intended to encourage employers to guess at the probability of an accident in deciding whether to obey the regulation. When human life or limb is at stake, any violation of a regulation is "serious."...

Arute contends further that no attempt was made by the Secretary to introduce "objective evidence" tending to show that the activity in question was a "recognized" hazard. In support of this contention Arute cites Southern Ohio, supra. In that case the Sixth Circuit Court held that the Secretary failed to carry his burden of proving a violation of either the general duty clause or the 1926.28(a) standard. Section 5(a)(1) of the Act, 29 U.S.C. 654(a)(1), the so-called general duty clause, provides that each employer:

> shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

The burdens of proving violations of the general duty clause and the personal protective equipment standard differ to some extent. By the terms of the clause, the Secretary must prove (1) that the employer failed to render its workplace "free" of a hazard which was (2) "recognized" and

(3) "causing or likely to cause death or serious physical harm.[3/] Whether or not a hazard is "recognized" is a matter for objective determination. But even under the general duty clause the test to be applied is not general usage in an industry, as Arute would have it, but the common knowledge of safety experts who are familiar with the circumstances of the industry or activity in question. National Realty & Constr. Co. v. OSHRC, 489 F.2d 1257, 1265 n. 32-1266 n. 37 (D.C. Cir. 1973). In Southern Ohio, the Sixth Circuit Court indicated that it had adopted the definition of "recognized hazard" as enunciated in National Realty, and that in determining whether the employer violated the 1926.28(a) standard, a similar objective test is applied:

> We hold that §1926.28(a) requires an employer to require the wearing of appropriate safety equipment by his employees whenever a reasonably prudent employer, concerned with the safety of his employees, would recognize the existence of a hazardous condition and protect against that hazard by the means specified in the citation. This holding is consistent with our decision in Schriber Sheet Metal & Roofers, Inc. v. OSHRC, 597 F.2d 78 (6th Cir. 1979), adopting a similar test for compliance with the general duty clause (section 5(a)(1) of the Act).

649 F.2d at 460.

3/ The "likelihood"-of-injury element in the general duty clause has not been interpreted by either the Commission or the courts as imposing a 51% probability test. As it was noted in the leading case of National Realty & Constr. Co. v. OSHRC, 489 F.2d 1257, 1265 n. 33:

> Presumably, any given instance of equipment riding carries a less than 50% probability of serious mishap, but no such mathematical test would be proper in construing this element of the general duty clause. See Morey, the General Duty Clause of the Occupational Safety and Health Act of 1970, 86 Harv.L.Rev. 988, 997-998 (1973). If evidence is presented that a practice could eventuate in serious physical harm upon other than a freakish or utterly implausible concurrence of circumstances, the Commission's expert determination of likelihood should be accorded considerable deference by the courts. For equipment riding, the potential for injury is indicated on the record by Smith's death and, of course, by common sense.

None of Arute's witnesses was presented as being a safety expert in the construction field, and none demonstrated that careful thought was given to procedures for limiting employee exposure to fall hazards. On the other hand, the compliance officer had been a construction worker for a number of years before being employed as a safety specialist for some 10 years, initially with the Connecticut labor department and since 1978 with OSHA. While with OSHA, he had conducted almost one thousand construction-site inspections, including some involving bridges (Tr. 8-12). The compliance officer testified that the use of safety belts by Arute's employees was a necessary safeguard against a risk of serious injury. The record supports the conclusion that Arute's failure to require its employees to use safety belts while working on the 16- to 22-foot-high bridge was unreasonable under the circumstances and was a serious breach of the personal protective equipment standard. The $240 proposed penalty is in accord with the penalty criteria of section 17(j) of the Act.[4/]

## FINDINGS OF FACT

1. In November 1981, several of Arute's employees, while installing wood planking along the horizontal beams of an overpass bridge, walked along the top of 16-inch-wide upper flanges of I-beams and stood on wood planking interspaced along the lower flanges of the I-beams.
2. The potential fall distance was 16 to 22 feet.
3. Arute's employees were not provided with any form of fall protection.

---

4/ Section 17(j), 29 U.S.C. §666(j), provides:

The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

4. The use of safety belts was feasible.

5. Arute's employees were exposed to the danger of falling 16 to 22 feet to adjacent ground level.

6. Serious physical harm was substantially probable in the event an employee fell from the bridge structure, and Arute should have known of the violative condition.

## CONCLUSION OF LAW

Arute seriously violated the personal protective equipment standard, 29 C.F.R. §1926.28(a), and a penalty of $240 is appropriate.

## ORDER

It is ordered that the citation alleging serious violation of 29 C.F.R. §1926.28(a) is affirmed, and a penalty of $240 is assessed.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>EYELET SPECIALTY COMPANY,<br><br>Respondent,<br><br>UNITED STEELWORKERS OF AMERICA, LOCAL UNION 8298,<br><br>Authorized Employee Representative. | OSHRC Docket No. 81-503 |

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor and Eyelet Specialty Company submitted to former Administrative Law Judge Barbara L. Hassenfeld a settlement proposal. Judge Hassenfeld had earlier participated in a telephone conference with representatives of the Secretary, Eyelet Specialty and the United Steelworkers of America Local Union 8298. There, the Secretary and Eyelet Specialty informed the judge that they had reached agreement but the union stated that it "had some problem" with the agreement. The judge then ordered "that the union file its written objections . . . by August 17, 1981." (Emphasis in the original.) The settlement was received by the judge on August 10, 1981, and was approved on the same day.

The union represents that it had mailed its letter of objections to the settlement proposal on August 13, 1981. Although the letter was not received

until August 19, 1981, it was nevertheless timely filed because, under Commission Rule 8(c), 29 C.F.R. § 2200.8(c), "[f]iling is deemed effected at the time of mailing." The union's objections should have been considered before the judge approved the settlement proposal. See Hearst Corp., OSHRC Docket No. 80-6051 (August 31, 1982).

We remand for a judge to give consideration to the union's objections in light of our recent decision in Mobil Oil Corp., 82 OSAHRC ____, 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982); see Wisconsin Steel Corp., OSHRC Docket No. 78-4730 (August 31, 1982). 1/ Accordingly, the judge's decision is vacated and the case is remanded for further consideration of the union's objections. 2/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: SEP 27 1982

---

1/ After Judge Hassenfeld filed her decision approving the settlement, she responded to the union by letter. We do not consider the views expressed in her letter to relate to the merits of the union's objections, but only to the union's right to raise those objections before the Commission.

2/ Chairman Rowland dissents from this order of remand. For the reasons explained in his dissenting opinion in Mobil, the Chairman believes that consideration of the settlement agreement should be limited to any objection the union may have to the reasonableness of the abatement period agreed to by the Secretary and Eyelet Specialty. Since the union's objection does not pertain to the reasonableness of the abatement period in the settlement, a remand for consideration of the adequacy of the settlement is inappropriate. Chairman Rowland would therefore affirm the judge's decision on this ground.

| SECRETARY OF LABOR, | : | |
| Complainant | : | |
| v. | : | OSHRC DOCKET NO. 81-503 |
| EYELET SPECIALTY COMPANY, | : | |
| Respondent | : | |

**ORDER**

On January 19, 1981, Respondent was cited for alleged failure to correct violations of the Occupational Safety and Health Act of 1970 (the Act) and was issued a total proposed penalty of $9,000.00. Respondent contested the citation.

Through a Settlement Agreement, executed by the parties, the Complainant moved to reduce the penalty to a total of $3,500.00. The Respondent withdrew its Notice of Contest. The penalty has been paid, the violations will be abated as per the terms of the agreement. Notice was served in compliance with the Act and the union filed no objection nor did it sign the agreement. Objections had been noted orally and the Respondent's attorney conversed with the union in that regard.

The Settlement Agreement, being in accordance with the purposes and objectives of the Act, is hereby approved.

For the Respondent.

## DECISION AND ORDER

Schwartz, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("The Commission") pursuant to Section 10 of the Occupational Safety and Health Act of 1970, 29 USC §651 et. seq. ("the Act"). Respondent contests a serious citation alleging two violations of the Act and a non-serious violation alleging one violation of the Act.

An inspection was conducted at Respondent's workplace on December 3, 1981. Respondent timely contested the subject citations. A hearing was held on June 18, 1982, at Dallas, Texas. No additional persons desired to intervene in this matter.

Respondent is engaged in a business affecting commerce within the meaning of the Act and the Commission has jurisdiction of the parties and subject matter (T. 8, 29). The issues remaining to be decided are two-fold. First, whether the Respondent was in serious violation of 29 CFR 1926.451(a)(4), 450(a)(10); and non-serious violation of 1926.150(a)(4). If so, the appropriate penalties therefor.

## The Evidence

The Secretary presented its compliance officer, Mr. William E. Rogers. He has been a compliance officer with OSHA for eight years. He conducted an inspection of Respondent's workplace on December 3, 1981 (T. 5-6). Mr. Rogers was assigned to inspect the worksite by his supervisor. The supervisor had observed what he thought was a scaffold on which people were not tied off as he drove by the worksite. Mr. Rogers checked the scaffold and did not issue a citation for this situation. He determined, after consultation with the national office, that the scaffold met the intent of the standards (T. 18-19).

Mr. Rogers testified that he observed two men working on a metal scaffold that was resting on the basement floor. They were slightly below the level of the sidewalk. The trunks of their bodies were extending above the sidewalk. The scaffold was unguarded on all sides (T. 9). Management's representatives told him the scaffold was 11' above the floor level. He understood that the scaffold had been unguarded for a couple of days (T. 10). He did not know if the scaffold had been in the same location for the two days prior to the inspection (T. 19).

The compliance officer also observed a portable ladder resting at an angle against the platform of the scaffold. The ladder was not tied off. It was secured by management during the inspection and prior to the compliance officer's listing of possible violations. There were permanent stairs for access to the basement. The employees could use the stairs to come into the basement and then gain access to the scaffold by climbing the ladder. He did not know how long the ladder had been unsecured and did not observe employees use the ladder. He did not make a determination if employees had used the ladder (T. 13-14). It is an acceptable practice within the construction industry for one employee to hold the ladder while another climbs it. He would consider this to constitute securing the ladder.

The final item involved fire extinguishers on the seventh and eighth floors by the elevator. The extinguishers had a dial indicator at the top which shows whether they had been discharged. Both extinguishers were observed to indicate they had been discharged (T. 16). He was aware that the building being renovated had charged fire hoses available on each floor. He also agreed that the fire extingushers were not required on this job. However as he understands OSHA regulation', if the extinguishers are there, they must be kept operational (T. 20).

Mr. Marlin Allen appeared and testified on behalf of the Respondent. He is the job superintendent at the subject worksite. Mr. Allen has been in the construction business for 14 years (T. 22). He described the circumstances surrounding the lack of guardrails on the platform. The scaffold had originally been underneath the sidewalk in order to collect broken concrete. This would prevent the need to retrieve the concrete from the basement. There were no guardrails or employees on the scaffold during this operation. At the time of the inspection they

were in the process of resetting the scaffold for form work in the new location. They had moved the scaffold the day of the inspection. The employees on the scaffold were in the process of securing the scaffold and would then have put up guardrails (T. 22-24; 26).

He also explained the fire extinguishing system present in the building. There was an active fire department standpipe system in the building with fire hose connections. Fire hoses were at the standpipes. His employees were informed about the makeup and use of this system (T. 25).

Mr. Bill Young, Vice President, Texas Olson Construction Company also appeared and testified. He has 22 years of construction experience and is manager of Texas Olson Construction Company. Respondent has a safety program on a company wide and division by division basis. There is a full time safety director who goes to the job-sites and works with the job superintendents. He testified that the company is very safety conscious and stresses safety with its employees. Incentives are offered for safe work (T. 27-28).

Mr. Young felt that the citation was unwarranted in this instance. He emphasized that they were in the process of resetting a scaffold that had not been completely set up. It had been in a position of 12" under a slab of concrete where you could not put guardrails on it. The inspector happened to come on the job after they had opened a hole for an electrical vault and moved the scaffolding. They were in the middle of resetting the scaffold (T. 29-30).

## Opinion

The Secretary has established that guardrails were not in place on the 11' scaffold in the basement. Two employees were on the scaffold. The Respondent

has explained that these employees were in the process of resetting the scaffold for use. The guardrails would have been installed prior to actual use of the scaffold at the new location. The scaffold had just been moved at the time of the inspection. There is no evidence that it had been used without guardrails, except to collect concrete prior to the compliance officer's visit. Under these circumstances, I conclude that Respondent did not violate 29 CFR 1926.451(a)(4). The employees were on the scaffold for the sole purpose of resetting it for use at the new location.

There is also no question that the portable ladder was not tied, blocked or secured. However the evidence of record does not establish that the two employees used the ladder in an unsecured condition to gain access to the scaffold. It is just as reasonable to infer that one employee held the ladder for the other while they ascended the scaffold. The compliance officer indicated that this is an acceptable alternative. It is also reasonable to infer that the ladder would be tied off after the resetting of the scaffold for future use. Under these circumstances I conclude that a violation of 29 CFR 1926.450(a)(10) has not been established.

The final allegation concerns the defective firefighting equipment noted by the elevators on the seventh and eighth floors. These extinguishers registered as discharged. All parties agreed there were charged water hoses available on each floor of the building under renovation. The compliance officer indicated that the presence of water hoses meant that the cited extinguishers were not required on the site. It was his opinion that if they were there they must be kept in an operational condition.

The undersigned assumes that Mr. Rogers was concerned about an employee grabbing a discharged extinguisher to fight a fire. Respondent established that the building was a renovation project. Respondent had informed all of its employees

about the fire system in effect and how to put out any fires with the hoses. In view of the above I conclude that Respondent was not in violation of 29 CFR 1926.150(a)(4) in the case.

## Conclusions of Law

1. Respondent, Olson Cosntruction Company, d/b/a Texas Olson Construction Company, is engaged in a business affecting commerce and has employees within the meaning of Section 3(5) of the Act. The Commission has jurisdiction of the parties and of the subject matter of the proceeding.

2. On December 3, 1981, Respondent was not in serious violation of 29 CFR 1926.451(a)(4); 1926.450(a)(10), or nonswerious violation of 1926.150(a)(4).

## Order

On the basis of the foregoing Findings of Fact and Conclusions of Law, it is ORDERED that:

1. Items 1(a) and 1(b) of serious citation number 1 and item 1 of non-serious citation number 2 are VACATED.

NOTICE OF DECISION

Secretary of Labor v. General Drywall Contractors, Inc.
OSHRC Docket No. 82-0005

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 26, 1982, and will become the final order of the Commission on September 27, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 27, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

For the Complainant.

R. Terry Oates
Houston, Texas

For the Respondent.

DECISION AND ORDER

Schwartz, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("The Commission") pursuant to Section 10 of the Occupational Safety and Health Act of 1970, 29 USC §651 et. seq. ("the Act"). Respondent contests a serious citation alleging a violation of 29 CFR 1926.304(d).

An inspection was conducted at Respondent's workplace on December 11, 1981. General Drywall timely contested the subject citation. A hearing was held in

Houston, Texas, on June 21, 1982. No additional persons desired to intervene in this matter.

Respondent is engaged in a business affecting commerce within the meaning of the Act and the Commission has jurisdiction of the parties and subject matter (T. 9). The issues remaining to be decided are two-fold. First, whether the Respondent was in serious violation of 29 CFR 1926.304(d) and, if so, the appropriate penalty to be assessed.

## The Evidence

The Secretary presented its compliance officer, Mr. Oscar G. Ray. Mr. Ray has a bachelor's degree in safety and fire protection. He has been a compliance officer with OSHA for the past five years (T. 7-8). He also has previous safety experience with the United States Postal Service.

Mr. Ray conducted an inspection of Respondent's worksite in December 1981. Respondent was engaged in putting up sheetrock in the interior of a building under construction. He observed a chopsaw being used by Respondent's employees. The chopsaw did not have a lower guard on it. Mr. Ray photographed the saw. The photographs depict the saw plugged in and ready for use with a piece of wood inserted in the saw. He described the hazard as involving the possible loss of a limb or severe cuts because of the lack of a lower guard. Abatement could be accomplished by placing a guard on the machine or by taking the saw out of service. The saw could have been unplugged and red-tagged at the site (T. 11-16; Complainant's Exhibits 1 & 2).

Mr. Terry Oates appeared and testified on behalf of the Respondent. He is Respondent's general superintendent and has approximately 15 years construction experience (T. 22).

Mr. Oates described the chopsaw guard as a flimsy clear plastic piece of material which is bolted to one side of the chopsaw. The guards break quite often. Mr. Oates stated that his foreman called him between 7:30 a.m. and 8:00 a.m. on the day of the inspection to report a broken chopsaw guard. Mr. Oates told his foreman that he would replace the saw with a new one and instructed him not to use the saw. The foreman indicated that he would not use the chopsaw. There was ample work to perform at the site that did not necessitate the use of the chopsaw.

Mr. Oates was overseeing 15 jobs on the day of the inspection. He had several stops to make before he could deliver the new chopsaw to the particular worksite. He brought the new chopsaw out to the worksite at approximately 1:00 p.m. that afternoon. OSHA had already conducted a general inspection of the worksite and noticed the unguarded saw. He was essentially contesting the proposed penalty because of the time element involved in reaching the worksite and because he had instructed his people not to use the saw (T. 23-27).

## Opinion

The photographic exhibits clearly depict Respondent's chopsaw plugged in and ready for use at the subject worksite. I have no doubt that Mr. Oates instructed his foreman not to use the chopsaw until he brought a guarded one out to the site. The foreman failed to unplug the saw, red-tag it and remove it from the work area. He left the chopsaw available for use by employees. The foreman's action, must be imputed to management in this case. Consequently, the Secretary has met his burden of proof on the issue.

The violation is also properly classified as serious. Both parties acknowledge that a serious injury could result from contact with an unguarded chopsaw blade.

This was the very reason Mr. Oates instructed the job foreman not to use the chopsaw in question. The Commission has held that a serious violation is established if there is a possibility of an accident which, if it occurs, creates a substantial probability that death or serious injury will result. Portland Stevedoring Co., 73 OSAHRC 30/D2, 1 BNA OSHC 1250, 1973-74, CCH OSHD ¶16,347 (No. 5, 1973). This situation exists in the instant case.

## Penalty Determination

I have observed Mr. Oates and find that he is a safety conscious individual. He has a valid argument, for penalty purposes, concerning the almost simultaneous breaking of the chopsaw guard and OSHA's general inspection at the subject worksite. The record indicates that in accordance with company policy, Mr. Oates was called immediately after the chopsaw guard broke. He instructed his foreman not to use the saw and delivered a guarded saw within a matter of hours. He had other business stops to make before getting to the site of the inspection. The case illustrates the need for a more specific direction to red-tag unguarded saws and other equipment until they can be replaced or fixed. There had been no previous violations of his instructions. I conclude that a large penalty would do little to further the purposes of the Act. The Act requires some penalty for a serious violation. Consequently, I assess a penalty of $1.00 for this particular violation. Reliance has been placed on the above circumstances as well as my belief that Mr. Oates is committed to safety at his worksites.

## Conclusions of Law

1. Respondent, General Drywall, is engaged in a business affecting commerce and has employees within the meaning of Section 3(5) of the Act. The Commission has jurisdiction of the parties and the subject matter of this proceeding.

2. In December, 1981, Respondent was in serious violation of 29 CFR 1926.304(d).

## Order

On the basis of the foregoing Findings of Fact and Conclusions of Law it is ORDERED that:

1. Item 1 of serious citation number 1 is AFFIRMED.

2. A penalty of $1.00 is assessed for the aforementioned item 1 of serious citation number 1.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge John S. Patton approving a settlement agreement entered into by the Secretary of Labor ("the Secretary") and Respondent, Whirlpool Corporation, is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Local 370 of the Allied Industrial Workers of America ("the Local Union") and International Union, Allied Industrial Workers of America ("the International Union") both petitioned for review of the judge's order. Both petitioners objected to a provision in the settlement agreement reducing the classification of an alleged violation of the Act from serious to other than serious. Commissioner Cottine subsequently directed review of this case on the issue of whether the judge erred in approving the settlement agreement.

We conclude that the settlement agreement should not be considered for approval without the opportunity of the employee representatives to comment. At

the time this settlement agreement was submitted for approval by the judge, Rule 100(c), 29 C.F.R. § 2200.100(c), of the Commission's Rules of Procedure, provided 1/ as follows:

> (c) Where parties to settlement agree upon a proposal, it shall be served upon represented and unrepresented affected employees in the manner set forth in § 2200.7. Proof of such service shall accompany the proposed settlement.

Commission Rule 7, which is referred to in Rule 100(c), provided (then, as now) in pertinent part as follows:

> (c) Unless otherwise ordered, service may be accomplished by postage prepaid first class mail or by personal delivery. Service is deemed effected at the time of mailing (if by mail) or at the time of personal delivery (if by personal delivery).
>
> * * *
>
> (f) Service and notice to employees represented by an authorized employee representative shall be deemed accomplished by serving the representative in the manner prescribed in paragraph (c) of this section.

In the settlement agreement now before us, Respondent certified that affected employees were notified of the settlement by posting of a copy of the agreement. However, under the Commission's Rules of Procedure, posting of a settlement agreement is adequate service on affected employees only if none of those employees are represented by an authorized employee representative. If any of the affected employees are represented by an authorized employee representative, that representative is entitled to service of a copy of the settlement agreement in the manner prescribed in Commission Rule 7(c), regardless of whether it has previously elected party status in the case. E.g., The Hearst Corp., OSHRC Docket No.

---

1/ Rule 100(c) has been amended since this settlement agreement was filed. However, the current rule retains the requirements that the settlement agreement be served on affected employees and that proof of this service accompany the settlement agreement. We note in addition that the criteria for approval of settlement agreements are set forth in Commission Rules 100(a) & (b), 29 C.F.R. § 2200.100(a), (b). Englehard Indus., OSHRC Docket Nos. 78-2880 & 78-3251 (Aug. 30, 1982), pet. for rev. filed, No. 82-3431 (3d Cir. Sept. 15, 1982); Mobil Oil Corp., 82 OSAHRC __, 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982).

80-6051 (Aug. 31, 1982); Babcock & Wilcox Co., 80 OSAHRC 95/A2, 8 BNA OSHC 2102, 1980 CCH OSHD ¶ 24,812 (No. 78-446, 1980); Reynolds Metals Co., 79 OSAHRC 4/A2, 7 BNA OSHC 1042, 1979 CCH OSHD ¶ 23,295 (No. 78-2485, 1979). Here, the Local Union and the International Union have indicated that they are authorized employee representatives within the meaning of the Commission's rules by filing their petitions for review. Moreover, in its brief on review, Respondent states that it personally served other documents in this case (but not a copy of the settlement agreement) on an unidentified "authorized employee representative." Accordingly, we conclude that the record does not establish that the settlement agreement was served on affected employees in compliance with Commission Rule 100(c). In addition, we note that the Secretary and Respondent, through correspondence with the judge, revised the abatement provisions of the settlement agreement after they had filed the original written agreement with the judge. The record contains no indication that affected employees were notified of this amendment through any means, even though such notification is required. See Babcock & Wilcox, supra. For these reasons, we disapprove the settlement agreement filed in this case and remand for further proceedings. 2/

---

2/ We reject the arguments raised by the Secretary and Respondent in opposition to Commission review of this settlement agreement. The direction for review in this case is valid because a Commissioner has the authority to direct review of a case on his own motion. Rule 92(d), 29 C.F.R. § 2200. 92(d) (at the time pertinent, designated Rule 91a(d), 29 C.F.R. § 2200. 91a(d)). In addition, contrary to the arguments of the parties, the Commission does have the authority to review settlement agreements. E.g., Raybestos Friction Materials Co., 80 OSAHRC 111/E14, 9 BNA OSHC 1141, 1980 CCH OSHD ¶ 24,910 (No. 80-2793, 1980) and cases cited. Accordingly, in order that the Commission may effectively exercise this authority, the general policy limiting Commission review to issues raised by a party before the judge is inapplicable to settlement agreements where a union has not had the opportunity to voice objections. Because the direction for review is otherwise valid, any defects in the underlying petitions for review would have no effect on the Commission's authority to review this case. See, e.g., Little Beaver Creek Ranches, Inc., 82 OSAHRC _____, 10

The judge's decision is set aside, the settlement agreement is disapproved, and the case is remanded to the Chief Judge 3/ for further proceedings consistent with this opinion. 4/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: SEP 29 1982

---

(Footnote 2 cont'd)

BNA OSHC 1806, 1809-10 n. 4, 1982 CCH OSHD ¶ 26,125 at p. 32,878 n. 4 (No. 77-2096, 1982).

We need not decide whether the Local Union and the International Union elected party status prior to the time the settlement agreement was filed with the judge. As indicated above, an authorized employee representative is entitled to service of a copy of a settlement agreement regardless of whether it has previously elected party status. Furthermore, we construe the petitions for discretionary review filed by the International Union and its local, as well as the specific election subsequently filed with the Commission, to be effective elections of party status in this case. See Commission Rule 20(a), 29 C.F.R. § 2200.20(a). On remand, the Local Union and the International Union will be provided an opportunity to participate as parties to the proceedings.

3/ Judge Patton has retired.

4/ Chairman Rowland dissents from the Commission's order disapproving the settlement agreement and remanding this case for further proceedings. Notwithstanding any defect in the service of the settlement agreement, the record establishes that the Local Union and the International Union both received actual notice of the agreement and that both have had the opportunity to state their objections to the agreement. Those objections are limited to a provision in the settlement agreement reducing the classification of the alleged violation from serious to other than serious. However, the Chairman believes consideration of the settlement agreement should be limited to any objections the unions may have to the reasonableness of the abatement period agreed upon by the Secretary and Whirlpool. Since the unions have raised no objection to the reasonableness of the abatement period, in the Chairman's opinion, further consideration of the adequacy of the settlement agreement is inappropriate. See Mobil Oil Corp., supra note 1 (dissenting opinion). See also, Englehard Indus., supra note 1 (dissenting footnote) (union party not entitled to hearing on objection to reduction in classification of violation).

## ORDER APPROVING SETTLEMENT AGREEMENT

This case is before the Occupational Safety and Health Review Commission on the complaint of complainant alleging that respondent permitted its employees to be exposed to carbon monoxide gas exceeding the 8-hour time weighted average of 50 parts per million for carbon monoxide, in violation of standard 29 C.F.R. 1910.1000(a)(2).

On May 21, 1979, a settlement agreement settling the issues in the case was filed. In the settlement agreement complainant amends the designation of the alleged violation from "serious" to "other." The penalty is reduced from $800 to $0. It is stated that in order to abate the respondent shall install catalytic converters on 23 forklift trucks. In addition, respondent shall install plexiglass wind deflectors on 15 forklift trucks which have LPG tanks fixed in a horizontal position. The parties, by letters, subsequently amended the provisions to provide for wind deflectors on 14 rather than 15 forklift trucks.

The respondent withdraws its notice of contest to the citation, as amended by the settlement agreement. It is stated that the settlement

agreement has been posted as required by the Rules of the Occupational Safety and Health Review Commission.

It is therefore ORDERED that:

The settlement agreement be and hereby is approved.

The aforesaid amendments to the citation and notification of proposed penalty are approved.

The withdrawal by the respondent of the notice of contest is approved.

The citation and notification of proposed penalty, as said documents are amended by the settlement agreement, are affirmed.

Dated this 11th day of June 1979.

STIPULATION AND SETTLEMENT AGREEMENT

I

The parties have reached agreement on a full and complete settlement of the instant matter which presently is pending before the Occupational Safety and Health Review Commission (Commission.)

II

The parties stipulate as follows:

(a) The Commission has jurisdiction of this matter pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 84 Stat. 1590, 29 U.S.C. §651 et seq. (Act).

(b) Respondent, Babcock & Wilcox Company, is engaged in the business of manufacturing diversified products and maintains corporate offices in New York, New York. On or

about September 27, 1978 through September 29, 1978, Respondent maintained a worksite at East Works 27th Street, Beaver Falls, Pennsylvania, where it was engaged in manufacturing tubular products for shipment to points outside the Commonwealth of Pennsylvania.

(c) As a result of the aforesaid activities, Respondent, on or about September 27, 1978 through September 29, 1978, was an employer engaged in interstate commerce within the meaning of sections 3(3) and 3(5) of the Act, and employed employees within the meaning of section 3(6) of the Act.

(d) An inspection of Respondent's Beaver Falls worksite was conducted by a duly authorized Compliance Officer of the Occupational Safety and Health Administration (OSHA) on or about September 27, 1978 through September 29, 1978. As a result of this inspection, Respondent, on November 6, 1978, was issued three Citations, pursuant to section 9(a) of the Act, and a Notification of Penalty, pursuant to sections 10(a) and 17 of the Act, recommending a total penalty of $12,150.

(e) By letter dated November 28, 1978, Respondent notified the Pittsburgh, Pennsylvania OSHA Area Director of its intent to contest the citations and proposed penalty. Respondent's letter was received by the Pittsburgh OSHA Area Office on December 1, 1978 and thereafter was duly transmitted to the Commission.

(f) A Complaint was filed on filed on December 21, 1978; an answer was filed on January 3, 1979.

(g) By letter dated December 28, 1978, the United Steelworkers of America and its Local 1082 (Union), the authorized bargaining agent for the employees, elected party status in this matter.

III

Complainant hereby withdraws the citations issued on November 6, 1978 and his Petition for Discretionary Review filed August 11, 1980.

IV

Respondent and the Union have no objection to Complainant's withdrawal of the citations and Petition for Discretionary Review.

V

Respondent hereby withdraws its Notice of Contest and makes the following representations and assurances:

(a) With respect to all items of the Citations and Notification of Proposed Penalty alleging violation of the Act, the alleged conditions have been abated and shall remain abated.

(b) Respondent currently is complying, and in the future will continue to comply, with the provisions of the Act and applicable standards promulgated thereunder.

VI

Based on the aforesaid assurances by Respondent, Complainant and the Union have no objection to Respondent's withdrawing its Notice of Contest.

VII

The Union hereby withdraws its Petition for Discretionary Review filed August 15, 1980.

VIII

Complainant and Respondent have no objection to the Union's withdrawing its Petition for Discretionary Review.

IX

Respondent hereby certifies that this Stipulation and Settlement Agreement has been served on affected employees in the manner set forth in Section 7 of the Rules of the Commission by posting, on the 14 day of September, 1982, in a place where the Citation is required to be posted, a copy of this Agreement as to inform employees who are not represented by an authorized employee representative, if any, in accordance with Section 7(g) of the Rules of the Commission.

X

Each party hereby agrees to bear its own fees and other expenses incurred by such party in connection with any stage of this proceeding.

Susan R. John
FOR COMPLAINANT

William C. Lucas
FOR RESPONDENT

Mary Wise Olz
FOR THE AUTHORIZED EMPLOYEE REPRESENTATIVE

Dated this 20th day of September, 1982.

## CERTIFICATE OF SERVICE

I hereby certify that a copy of the foregoing Stipulation and Settlement Agreement was mailed, postage prepaid to, William C. ## NOTICE OF DECISION

Secretary of Labor v. COATINGS, INC.
OSHRC Docket No. 81-2407

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 30, 1982, and will become the final order of the Commission on September 29, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 29, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Attn: Aaron M. Smith, Esq.

FOR RESPONDENT

William D. Fletcher
Safety Consultant
Fletcher Associates, Inc.
31 Covered Bridge Lane
Newark, Delaware 19711

Brennan, W. E., A.L.J.

STATEMENT OF THE CASE

This case arises under the provisions of Section 10(c)[1/] of the Occupational Safety and Health Act of 1970 (hereinafter the Act).[2/] There is at issue a one-Itemed Serious Citation issued pursuant to Section 9(a) of the Act[3/] by the Secretary of Labor through the Area Director of the Occupational Safety and Health Administration (OSHA) for Wilmington, Delaware, (hereinafter Complainant) to Coatings, Incorporated of Wilmington, Delaware, (hereinafter Respondent). A penalty of $630 was proposed by Complainant pursuant to Section 10(a) of the Act.[4/]

After the filing of a Notice of Contest (R.p. 3)[5/] and the perfection of the pleadings, the hearing herein was held in Wilmington, Delaware. No affected employee or representative thereof claimed party status (Tr. 12).

1/ 29 U.S.C. 659(c).

2/ 29 U.S.C. 651 et seq.

3/ 29 U.S.C. 658(a).

4/ 29 U.S.C. 659(a).

5/ References herein translate as follows:

R.p. 3 The third numbered document in the official Docket File prior to assignment to the undersigned.

R.p. J-3 The third numbered document in the official Docket File after assignment to the undersigned.

Tr. 27 Page 27 of the hearing transcript.
Exh. C-1 Complainant's Exhibit in evidence.
Exh. R-1 Respondent's Exhibit in evidence.

This Citation arose as the result of a fatal accident to one of Respondent's employees, Lloyd L. Penland, which occurred on August 3, 1981, at Respondent's worksite, a large water intake pipe which extends over 1,000 feet into the Delaware River from the old Atlas Point Treatment Plant, now occupied by a manufacturing concern called I.C.I. Americas, Inc., at New Castle, Delaware.

The Serious Citation alleges as follows:

> Item 1
> 29 CFR 1926.106(c): Ring buoys with at least 90 feet of line were not provided and readily available for emergency rescue operations:
>
> (a) Atlas Point Treatment Plant, river water intake structure; employees performing sand blasting and painting operations on the intake line were working over water at a point about 900 feet out in the Delaware River, 8/3/81

An "immediate" abatement date was ordered and a $630 penalty proposed.

The Occupational Safety and Health Standard which was cited provides:

> 29 C.F.R. 1926.106 WORKING OVER OR NEAR WATER.
>
> * * *
>
> (c) Ring buoys with at least 90 feet of line shall be provided and readily available for emergency rescue operations. Distance between ring buoys shall not exceed 200 feet.

## ISSUES

1. Did the Respondent violate the cited Standard?

2. If so, what penalty is appropriate?

Issue number 1 is answered affirmatively and a penalty, appropriate under Section 17 of the Act, 29 U.S.C. 666(i), is assessed, infra.

## EVIDENCE

The evidence herein reveals that some time in the early part of July, 1981, Respondent was engaged by I.C.I. Americas, Inc. (hereinafter I.C.I.) to sandblast and paint a large water intake pipe servicing the I.C.I. manufacturing plant located at the old Atlas Chemical Plant in New Castle, Delaware. This pipe, which was about 3 feet in circumference, extended out from the I.C.I. plant shoreline some 1,500 feet into the Delaware River. The pipe rested upon a large, permanent pier structure, which also supported a permanent catwalk immediately to the right of the pipe when viewed from the shoreline.

At the beginning of this job, Respondent utilized a large barge as a floating working platform, which was also used to store sandblasting and paint material and equipment. The work began at the river end of the pipe. The pipe was first sandblasted and then spray painted. A large mobile, compressor was used in this operation and was located on the barge. Respondent's employees utilized some type of safety-belt, swing arrangement,

to paint the underside of the pipe as the barge was too large and the rise and fall of the tide too great, to allow the use of the barge under the pipe.

This arrangement for painting the pipe was not satisfactory so approximately one week prior to August 3, 1981, Respondent purchased a 27-foot pleasure boat to be used as a work platform. This boat, shown in Exhibits C-5 and C-7, had a small forward deck, a flying bridge on its cabin top, and an open cockpit, thus providing three to four different levels upon which employees could stand to work on the pipe.

On Sunday, August 2, 1981, the deceased Lloyd Penland and one of his sons, Ricky Penland - both employees of Respondent, went to this worksite to do some painting. After working for a couple of hours, painting from the barge which was moored adjacent to the pipe, they decided to use the pleasure boat to go out and do some fishing in the river.

After the brief fishing trip, the father dropped his son Ricky and a younger son Robert, off at New Castle, and he brought the boat back to the worksite.

The following morning, August 3, 1981, Lloyd Penland, and another son Ray, who was also an employee of Respondent, went to the worksite. Upon their arrival they noticed that the pleasure boat was not tied up to either the barge moored alongside the pipe or to the catwalk. After unlocking a gate on the shore end of the catwalk, they went out onto the catwalk

about 900 feet to which point the work had progressed. They noticed the pleasure boat anchored from 30 to 50 feet away from the catwalk. Evidently, when Lloyd Penland had returned the boat to the worksite the previous day, he had moored it to the pier on which the catwalk was located, rather than tying it to the barge, and also put an anchor out. The tide went out, and because there was not sufficient slack in the mooring lines, these lines pulled the cleats out of the boat's deck which drifted away from the pier the 30 to 50 feet, dragging its anchor until the anchor finally caught.

The father, Lloyd Penland then went aboard the barge and attempted to start the engine of a compressor located thereon. It evidently would not start and both Penlands knew that there was a battery charger on board the pleasure boat, now anchored from 30 to 50 feet away from the catwalk.

Although the son Ray offered to go to the boat (ostensibly to bring it and/or the battery charger back to the pier), the father Lloyd said no. Instead the father disrobed and entering the river from the catwalk, swam over to the boat. Upon arriving at the boat, he attempted to climb out of the water on to it, but the sides were too high. According to his son Ray, the father yelled for help. Ray swam to his father's aid. Upon reaching him, they both were twice pulled under the water presumably from current action. The father told the son to save himself and then disappeared under the surface of the

river. Ray finally swam to shore, went to a brother's home, who called the U. S. Coast Guard (See Exh. C-1, statement of Ray Penland.). Although both the Coast Guard and a local rescue squad responded, Lloyd, the father drowned (See Exh. C-3(b), the Coast Guard Report).

Mr. Palmer C. Tackett, a Compliance Officer (C.O.) with the OSHA Wilmington office heard a news report of the accident. After checking with the Delaware State Police who had investigated the tragedy on the day of its occurrence, C.O. Tackett made an inspection of the worksite on August 5, 1981.

The C.O. first went to the offices of Respondent and spoke with its President, George H. Huber. Mr. Huber was busy attending to details resulting from the accident and told the C.O. to go on ahead of him to the worksite and conduct his inspection and he would join him there later.

The C.O. proceeded to the I.C.I. plant site and met with I.C.I.'s Safety Director and Plant Engineer. This party of three then proceeded to the river bank. The gate which secured the catwalk and pipe pier area was unlocked by the I.C.I. people and the party walked out onto the catwalk. The barge was tied to the pipe side of the pier and the pleasure boat was tied to the barge on its other side. The C.O. took photographs of the pipe-catwalk pier, the barge, boat, and the decks of both vessels (See Exhs. C-4 thru C-9).

The C.O., who had been advised by the Delaware State Police not to go aboard the boat as it had been damaged, conducted his inspection and photographing of the scene from the catwalk. He did not go aboard either the boat or barge. He testified that he was unable to see either life jackets or ring buoys on either the catwalk, barge or boat. No one was present during this inspection except the 3-member inspection party, as the Respondent, as testified to by the President, performed no more work on this project after the accident. The two I.C.I. members of the party advised the C.O. that the scene as observed on August 5, 1981, was just as it had been on August 3, 1981, as nothing had been altered and the entire pier bearing the pipe and catwalk had been secured by keeping the chain-link gate locked at the shoreline. They further advised that their company had not supplied any life jackets, ring buoys or any other safety equipment to Respondent, as that responsibility was Respondent's under its contract with Respondent.

The C.O.'s inspection of the site took approximately 35 to 40 minutes. As he was leaving the I.C.I. plant property, Respondent's President Huber arrived and these two had a brief discussion.

On August 14, 1981, The C.O. went to the office of Mr. Huber where he interviewed the surviving son, Ray Penland, in Mr. Huber's presence. The C.O. reduced Mr. Penland's account of the accident to writing, and Mr. Penland signed this statement.

The C.O. posed two specific questions to Mr. Penland, which, together with Mr. Penland's answers, were added to this statement. These questions and answers were:

> Q. Why didn't you use life jackets or did you have life jackets.
> A. We had them but they were on the boat that had got loose.
> Q. Was there any ring buoys on the pier or barge.
> A. No, there was nothing like that out there. There was nothing I could throw to him.
> (See Exh. C-1)

On August 28, 1981, the C.O. held a closing conference with Respondent's President Huber. C.O. Tackett testified that during this conference Mr. Huber claimed that he did not know that he had to provide life rings, that his insurance company had not so advised him. Further, that Mr. Huber advised that he had stopped work on that job and if he recommenced, he would produce life rings. Additionally, Mr. Huber felt that life rings would not have helped in this case.

On cross-examination, C.O. Tackett stated that the first time he heard anything about ring buoys on the accident scene was during a conference between Respondent and Complainant and their representatives, held a number of months after the accident and prior to the trial (Tr. 21-146).

Respondent, who was represented by Safety Consultant William Fletcher, a non-lawyer, presented Respondent's President Huber as its first witness.

Mr. Huber testified that he inspected the pleasure boat involved when he bought it, about one week prior to the accident. At that time, he stated that this boat was equipped with two life jackets and mooring lines of 30 to 35 feet in length, but no ring buoy.

Additionally, he first testified that he got a ring buoy without any line attached to it from his warehouse and put it aboard the boat, telling Lloyd Penland to put a line on it (Tr. 154-155). However, he then testified that he gave the ring buoy to Lloyd Penland at his shop, early in this job, and it was Penland who first put it on the barge, prior to the purchase of the boat, and after the boat was purchased, Penland put the buoy on board the boat. Mr. Huber testified that the reason the ring buoy was taken to the worksite was because one of his employees, who was to work on this job, Jack Van Sant, could not swim (Tr. 156-157).

Mr. Huber further testified that he assigned Lloyd Penland and his son Ricky as the two-man crew to do the job in question. (Lloyd Penland was a 21-year employee of Respondent, and at least two of his sons, Ricky and Ray, were also employees of Respondent.) However, there were a "couple of days," (later said to be "three or four days") when Ray Penland substituted for his brother Ricky on the job (Tr. 157-158). Additionally, Mr. Huber testified that he went to this job-site every day (Tr. 185).

On cross-examination, Complainant produced the pages of the Gate Log for the I.C.I. plant covering the period when Respondent was working at the job-site, July 6, 1981, through August 3, 1981. This was a book maintained by I.C.I. at its gate, and all individuals, other than I.C.I. employees, were required to sign this log in order to be admitted onto the premises (See Exh. C-10, Tr. 186-238, 312).

This log seriously contradicted Mr. Huber's testimony, in that, he signed in on this log only eight times during the approximate one month period this job had been in progress, not every day as he stated in his testimony. Furthermore, a talley of the entries revealed that Lloyd Penland signed in 22 times during this period and his son Ray, 17 or 18 times, whereas his son Ricky, signed in only four times. Thus, for most of the relevant period, Respondent's work crew at this job-site was Lloyd and Ray Penland, not Lloyd and Ricky, as testified to by Mr. Huber.

This turn of events at trial makes the credibility of Mr. Huber's testimony open to very serious doubt. Thus, his testimony that during his visit to the site on the Friday before the Monday accident, that he saw the ring buoy in the cabin of the boat, cannot be fully credited (Tr. 161-172). During this Friday visit, Mr. Huber testified that he was at the site for approximately 15 minutes and talked with Lloyd Penland as they both stood on the catwalk. Mr. Huber stated

that he did not go aboard the boat that day, but saw the ring buoy in the boat's cabin near the mid-ship helm position from his catwalk position, the boat being tie to the catwalk side of the pier, bow to. A study of the configuration of the forward deck and cabin of this boat, Exhs. C-5 and C-7, and Mr. Huber's relatively high position on the catwalk, additionally strains the credibility of this testimony.

Respondent's second and last witness was Ricky Penland. He testified to the fishing trip on the boat the day before the accident and that a ring buoy was on board this boat that day. He further testified that he worked on this job, "about three -- or four weeks.", (Tr. 268). However, the Gate Log, Exh. C-10, shows that he signed onto the I.C.I. premises, only four times, not the three or four weeks he claimed. Similarly, because of the serious contradiction between his testimony and the I.C.I. Gate Log, as well as the inherent inconsistencies and evasiveness of his testimony throughout (Tr. 252-266), Mr. Ricky Penland's testimony cannot be credited.

In sum, there is no reliable or creditable evidence that any ring buoy was present anywhere on this job-site during the approximate one month period Respondent was engaged in sandblasting and painting the large pipe at this work-site.

## OPINION

The Standard which is the basis for the Citation herein mandates that, "Ring buoys with at least 90 feet of line shall be provided and readily available for emergency rescue operations. . . ." 29 C.F.R. 1926.106(i), emphasis supplied.

As concluded earlier, there is no creditable and reliable evidence establishing that there was any ring buoy, anywhere at this worksite, the worksite obviously including the large pier, the pipe and catwalk built thereon, the barge and the boat.

However, even if the testimony of Messrs. Huber and Ricky Penland is sufficiently creditable to establish the existence of one ring buoy aboard the boat in question, a violation of the cited Standard is nevertheless established in this record.

First, this Standard mandates "Ring buoys," in the plural. Secondly, each buoy must have 90 feet of line attached to it, for the obvious purpose to permit the buoy to be thrown to someone in trouble, and to then pull the person to safety. There is absolutely no evidence that the one ring buoy, supposedly on board the boat, had any line attached to it. To the contrary, the evidence, if believable, best supports the conclusion that the buoy never did have any line of any length attached to it.

Lastly, as this tragic accident conclusively establishes, even if there was one ring buoy on board the boat, it was not ". . . readily available for emergency rescue operations."

The violation as alleged in the Citation herein is established by the creditable evidence and this record considered as a whole.

Further, this violation is accurately denominated as a Serious violation, in that there was ". . . a substantial probability that death . . . could (and tragically did) result . . ." from this violative condition. 29 U.S.C. 661(j).

## PENALTY

After an independent evaluation of the penalty factors set out at Section 17(j) of the Act, 29 U.S.C. 666(i), coupled with the C.O. Tackett's testimony concerning the computation of the penalty as proposed, (Respondent employs approximately 16 employees, and did at the relevant times herein; had gross revenues "in excess of $50,000 in 1981"; and had been once previously cited for an OSHA violation Tr. 8, 9, 72-73), it is concluded that the proposed penalty of $630, because of the seriousness of the violation, is appropriate.

## CONCLUSION

The jurisdiction of the Review Commission in this case is not contested and is established by the pleadings and Stipulations pursuant to Sections 3(3), 3(5) and 10(c) of the Act, 29 U.S.C. 652(3), 652(5) and 659(c).

Based upon the foregoing which constitutes the findings of fact and conclusions of law herein, and pursuant to Sections 10(c) and 12(j) of the Act, 29 U.S.C. 659(c) and 661(i), it is hereby

ORDERED:

1. That the one-Itemed Serious Citation alleging a violation of 29 U.S.C. 654(a)(2) for failure to comply with the Occupational Safety and Health Standard set forth at 29 C.F.R. 1926.106(c), issued to this Respondent on September 10, 1981, is AFFIRMED.

2. The penalty of $630 as proposed is ASSESSED.

| v. | : | OSHRC Docket No. 13591 |
| PRATT & WHITNEY AIRCRAFT, DIVISION OF UNITED TECHNOLOGIES CORP., | : | |
| Respondent. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case has been remanded to us by the United States Court of Appeals for the Second Circuit. Pratt & Whitney Aircraft v. Secretary of Labor, 649 F.2d 96 (2d Cir. 1981). The court reviewed our decision in Pratt & Whitney Aircraft, Division of United Technologies Corp., 80 OSAHRC 38/A2, 8 BNA OSHC 1329, 1980 CCH OSHD ¶ 24,447 (No. 13591, 1980) and, inter alia, after vacating our action affirming both the alleged violation of 29 C.F.R. § 1910.94(d)(7)(iii) in the serious citation and one of the two alleged violations of 29 C.F.R. § 1910.132(a) in the non-serious citation, remanded for further proceedings consistent with its opinion on those two items. We have examined the briefs of the parties on remand and carefully reevaluated the record. We conclude that the section 1910.94(d)(7)(iii) allegation should be affirmed under the "significant risk" test adopted by the court. We vacate the section 1910.132(a) allegation on the Secretary's motion to withdraw the item.

A.

The section 1910.94(d)(7)(iii)[1/] allegation concerns Pratt & Whitney's ("P & W's") ventilation practices in its plating department. Its seven plating lines contained tanks of both cyanides and acids; one line also contained tanks of hydrogen peroxide, glacial acetic acid, and heated slushing oil. Each tank in each line had a separate exhaust duct, but those ducts merged into a common duct for each line, from which all the chemical exhausts from the line were vented through a stack in the roof. The Secretary alleged that the use of a common duct to ventilate both acid mists and cyanide mists in each line, and the use of a common exhaust duct in one line to ventilate the tanks of hydrogen peroxide, glacial acetic acid, and heated slushing oil constituted noncompliance with the cited standard. Acid mists and cyanide mists used in the plating processes, the Secretary alleged, are exhausted into the common duct system where they can combine into hydrogen cyanide gas ("HCN"), a highly

---

1/ Section 1910.94(d)(7)(iii) provides in pertinent part:

§ 1910.94 Ventilation

* * *

(d) Open surface tanks --

* * *

(7) System Design.

* * *

(iii) Two or more operations shall not be connected to the same exhaust system where either one or the combination of the substances removed may constitute a fire, explosion, or chemical reaction hazard in the duct system. Traps or other devices shall be provided to insure that condensate in ducts does not drain back into any tank.

poisonous and explosive substance. Also, the Secretary contends, when hydrogen peroxide and heated slushing oil are mixed there is a possibility of explosion, and the mixture of hydrogen peroxide and acetic acid results in potentially explosive peracetic acid.

Judge Abraham Gold vacated the section 1910.94(d)(7)(iii) allegation for failure of proof. He ruled that the Secretary's evidence does not demonstrate the existence of hydrogen cyanide gas or peracetic acid in the common duct system, and that it does not demonstrate hydrogen peroxide and slushing oil combine in the common duct. The judge stated:

> The Secretary has presented textbook theory, without obtaining readily available information which would show whether there existed at Respondent's facility those specific conditions required for the creation of a fire, explosion, or chemical reaction hazard. He has offered nothing more than conjecture. In addition, he suggests that a hazard might arise . . . by virtue of a ventilation breakdown, malfunction of the heating systems for the various solutions, spontaneous combustion caused by an employee's smoking, heat caused by mechanical failure, a down-draft of effluent or "by some yet unimagined happening." We have no showing of any reasonable likelihood of such mishaps; the Secretary might just as well have suggested the possibilities of arson or insurrection.

B.

The Commission reversed Judge Gold and affirmed the citation item. The Commission concluded that the use of the word "may" in the cited standard requires a violation to be found whenever a hazardous combination of substances in a duct system is possible. The Commission held that it is not necessary for the Secretary to prove that a chemical reaction was reasonably likely or that the prohibited hazards actually threatened employees at the time of inspection. The Commission further found, however, that the Secretary's proof demonstrated the "realistic

possibility" that hazardous HCN gas could be formed and that fire or explosions could result from a reaction in the duct of heated oil and either hydrogen peroxide or peracetic acid.

C.

The Second Circuit, citing the U.S. Supreme Court's decision in Industrial Union Department, AFL-CIO v. American Petroleum Institute, 448 U.S. 607, 100 S.Ct. 2844, 2864-66 (1980) ("the Benzene Case"), held that section 1910.94(d)(7)(iii) can properly be interpreted as proscribing an employer's use of a common exhaust system only where there exists a "significant risk," not a mere possibility, that a combination of the substances removed will cause a fire, explosion, or chemical reaction hazard. Although the court acknowledged that the Commission had also used the term "realistic possibility" in setting out its findings, the court found Commission use of those terms ambiguous and therefore vacated and remanded, stating:

> The OSHRC on remand may conclude that the risk of an explosion, fire, or chemical reaction hazard in Pratt & Whitney's ductwork was, indeed, significant. This decision is best left to the OSHRC in the first instance. It is the agency, not the courts, that possesses the required expertise to make such decisions. . . .

The court further stated, however, that it was

> . . . compelled to point out . . . that implicit in the opinion of the ALJ is a determination that the Secretary failed to establish even the remotest possibility of such mishaps occurring.
>
> * * *
>
> . . . while the OSHRC is not bound to accept the factual findings of the ALJ, the latter's determinations are entitled to some weight and should not be disturbed without explanation.
>
> * * *

> In arriving at its determination that the ductwork of petitioner's plant posed a possibility that a hazardous event might occur, the OSHRC relied upon the "textbook theory" rejected by Judge Gold. Additionally, the OSHRC noted that the Secretary's expert, Mr. Padden, had not recalled seeing similar ductwork in the "100 or so" other plating departments he had visited. The latter testimony, however, conflicted with that of petitioner's expert, Mr. Doyle, . . .
>
> * * *
>
> Furthermore, petitioner conducted scientific tests which revealed not a trace of the dangerous substances that the Secretary claimed might form. On remand, the OSHRC is obligated to weigh carefully all of the latter evidence in determining whether the Secretary has demonstrated by a preponderance of the evidence that the common ductwork at petitioner's plant violated § 1910.94(d)(7)(iii). Again, we express no view as to the proper outcome of this reconsideration: our concern is rather to assure that all the evidence is given appropriate weight and that the conclusion reached is adequately supported by a reasoned explanation.

The Commission invited the parties to file briefs on remand and both parties did so. Their arguments on remand are, for the most part, those made earlier when this case first came before us for decision. The Secretary argues that the record shows the hazard created by P & W's common duct system was the "probable formation" of deadly poisonous hydrogen cyanide gas. The gas could be hazardous to employees working on the roof where the gas was emitted, the Secretary contends, and to plating department employees should down-drafts return gas to the plant floor. The gas in the ducts, the Secretary asserts, presented a fire or explosion hazard. Finally, the Secretary reasserts that the record establishes that the combination of hydrogen peroxide and heated oil, and the combination of hydrogen peroxide and acetic acid presented fire and explosion hazards.

The Secretary also contends that the Second Circuit should not have applied the significant risk concept to this case. He argues that the Supreme Court in the Benzene Case, supra, specifically limited the requirement for a finding of significant risk to "permanent" standards promulgated under section 6(b) of the Occupational Safety and Health Act ("the Act"), as opposed to those standards, like the one involved here, which were promulgated under section 6(a) of the Act.[2/] This view is supported, the Secretary asserts, by the Seventh Circuit Court of Appeals in Super Excavators, Inc. v. OSHRC, 674 F.2d 592 (7th Cir. 1981), cert. denied, 102 S.Ct. 2958 (June 21, 1982).[3/] With the significant risk concept read out of the case, the Secretary argues, any possible vagueness in the cited standard could be cured by the application of the "reasonable person" test to the interpretation of the standard,

---

2/ Section 6(a) of the Act authorized the Secretary of Labor to adopt as an occupational safety or health standard any national consensus standard or any established federal standard without the necessity of complying with the procedural requirements of the Administrative Procedure Act ("APA"), 5 U.S.C. §§ 551-559, 701-706 (1977). The procedural requirements thus omitted include: publication in the Federal Register of notice of proposed rulemaking, opportunity for interested persons to express their views on the proposed rule, a statement in the rule of its basis and purpose, and publication in the Federal Register of the rule as adopted. The Secretary's authority to adopt standards without adhering to these procedural requirements expired two years after the effective date of the Act. In order to promulgate any standard after that period, the Secretary must comply wth the procedural rulemaking requirements contained in the APA and section 6(b) of the Act, 29 U.S.C. § 655(b), which include, among other things, notice of proposed rulemaking and opportunity for interested persons to comment.

3/ We point out to the Secretary that we must comply with the Second Circuit's order to use significant risk in this case on remand because the Second Circuit's decision constitutes the law of the case. See Briggs v. Pennsylvania R.R., 334 U.S. 304, 306 (1948). Furthermore, the Commission is required to comply with remand orders of the courts of appeals. Butler Lime and Cement Co. v. OSHRC, 685 F.2d 544 (7th Cir. 1981); Frank Irey, Jr., Inc., 77 OSAHRC 192/F11, 5 BNA OSHC 2031, 1977-78 CCH OSHD ¶ 22,283 (No. 701, 1977).

i.e., the standard would be read to require that a reasonable person perceive a hazard under the circumstances of the case.

P & W argues that all the Secretary offered to show was that if acid mists of certain concentrations were to mix with cyanide mists of certain concentrations in the common duct, HCN would evolve; and that if hydrogen peroxide mists of certain concentrations were to mix with heated slushing oil in the common duct at a certain temperature, there would be a fire or explosion potential; and that if peracetic acid mists of certain concentrations formed by the combination of hydrogen peroxide and glacial acetic acid were to combine with heated slushing oil in the common duct at a certain temperature, there would be a fire or explosion potential. P & W asserts that the Secretary utterly failed to prove the factual predicates which support the premises leading to his conclusions. P & W's testing, however, demonstrated that there was no HCN hazard because HCN was not present in the common duct, that the air velocity over the tanks containing oil and hydrogen peroxide resulted in duct temperatures too low to create fire or explosion hazards, and that slushing oil was not entering the common duct to create a fire or explosion hazard.

D.

Our consideration of this case on remand is governed by the instructions of the Second Circuit as quoted above. We interpret the cited standard at section 1910.94(d)(7)(iii), when applied under the "significant-risk" test to encompass the protection of employees from fire, explosion or chemical reaction hazards that are unusual or infrequent. Thus, the absence of proof of the actual existence of hazard-

ous chemical combinations in P & W's common duct system does not conclusively establish that P & W's employees were not exposed to a significant risk of harm.

The Secretary contends that acid mists and cyanide mists from the tanks in P & W's plating department could combine in its common duct to form deadly HCN gas, which poses a fire and explosion hazard because of its low flash point (0° F.). The Secretary also contends that, because HCN is poisonous, the gas could be hazardous to employees working on the roof of the plant should it be vented through the roof stacks, and to employees in the plant itself should a down-draft return the gas to the plating department.

Mr. Padden, the Secretary's expert witness, testified that if the surfaces of the acid or cyanide solutions were agitated by the immersion or retrieval of a part dipped into those solutions "mists and small gobblets [sic] would be readily drawn up into the main trunk line [of the common duct]" because of the about 200 feet per minute velocity of the air in the ventilation system blowing across those tanks. The solutions were heated and testimony indicated that heated solutions gave off more easily-transported mists and vapors than did cold solutions.[4/] Dunstan, P & W's industrial hygienist, acknowledged that it is not good practice to vent cyanide and acid mists through a common duct and that it can lead to HCN formation and fire and explosion hazards. P & W's

---

4/ The acid tanks in the plating department ranged in temperature from room temperature to 120° F.; the cyanide tank temperatures went from room temperature to about 150° F. If the steam valves malfunctioned, as they had on occasion, the temperatures of the acids and cyanides could go up even higher. If the temperatures exceeded the boiling point, larger globules of the particular solutions would be carried into the common duct, thereby increasing the potential for HCN formation.

expert witness, Mr. Doyle, acknowledged that cyanide mists could be drawn into the ductwork in the case of highly agitated solutions. Since parts were constantly being immersed into the solutions, we find that the solutions could become sufficiently agitated that cyanide mists could be drawn into the ductwork, react with the acid mists and vapors that were undisputedly already there, and form HCN.

Doyle's conclusion that there was not a hazard of HCN formation must be deemed modified by his acknowledgment that cyanide mists could be drawn into the ductwork in the case of highly agitated solutions. The fact that P & W's testing did not disclose the presence of any HCN gas in the common duct does not rebut this finding. P & W's evidence shows only that HCN was not present when the tests were made. It does not show that the conditions necessary for HCN formation would not arise.

If a down-draft occurred, HCN already formed in the common ducts could be swept back into the plant. The record shows that down-drafts could occur if P & W's ventilation system broke down, such as by a malfunctioning of the belts in the system. It is undisputed that ventilation system breakdowns had occurred in P & W's plant, and that one such breakdown had even occurred during the inspection of the plant. Belts in the system had broken. Further, the ventilation system in the plating department itself had broken down. These hazards were heightened by the fact that P & W had not provided for an alarm system to warn its employees of breakdowns in the ventilation system. Witness Champney, an employee in the plating department when the breakdown there occurred, described how he had become aware of the breakdown: "You started to smell and choke a little bit, and you realized that you were smelling

acid." Because HCN gas is one of the most potent of poisons, employees were therefore subjected to the hazard of being poisoned due to down-drafts occurring after ventilation system breakdowns.

The evidence also indicates that in the event of a down-draft acid mists could flow from the common duct down through the separate cyanide ducts, combine there with cyanide mists and enter the plating department. Thus, employees could be exposed to HCN formation due to a down-draft even if no cyanide mists had entered the common duct. We conclude that the Secretary has therefore proven that there was a significant risk of HCN poisoning from ventilation system breakdowns and resultant down-drafts.

The Secretary also contends, with respect to one of P & W's plating lines, that hydrogen peroxide and heated slushing oil could combine in the common duct to cause a fire or explosion. He alleges further that hydrogen peroxide and acetic acid, both of which were contained in one of the line's tanks, could combine to form peracetic acid; peracetic acid could combine with oil mists in the common duct and create fire and explosion hazards.

P & W's industrial hygienist, Dunstan, admitted that hydrogen peroxide and heated slushing oil entered the common ductwork. He conceded that there was a high hazard of an instantaneous explosion if the two chemicals were mixed. He further testified that peracetic acid was an explosive chemical formed by the mixing of hydrogen peroxide and acetic acid. He acknowledged that it is not good practice to vent the various chemicals in this line through common ducts and that it can result in fire and explosion hazards. Mr. Larsen, an industrial hygienist who

testified for the Secretary and inspected P & W's plant, stated that peracetic acid is an extreme oxidizing agent which should be kept away from organic materials and that exhausting peracetic acid and heated oil through the same duct presented fire and explosion hazards.

Padden, testifying for the Secretary, explained that if P & W's ventilation system failed, and the production of heated slushing oil and hydrogen peroxide continued, small globules of oil and chemicals would be emitted from the plating line tanks which could be drawn through the exhaust system into the common duct and cause a chemical reaction. When Padden was asked about the effect of a failure of P & W's ventilation system on the mixture of peracetic acid and slushing oil mists, he testified that the two substances would meet without diffusion. These reactions could result even if a down-draft did not occur. As noted above, the Secretary's industrial hygienist, Larsen, had testified earlier that exhausting peracetic acid and heated oil through the same duct presented fire and explosion hazards. Mr. Dupre, P & W's safety engineer, testified that a fire had previously occurred in P & W's ductwork.[5/] Consequently, in light of the above testimony and particularly in light of the abundant testimony from both the Secretary's and P & W's witnesses about failures in P & W's ventilation system, we find that the Secretary has proven there was a significant risk of fire and explosion in P & W's common duct system as a result of a combination of the aforementioned substances.

---

5/ This fire was attributed to careless smoking. However, ignition sources were not eliminated in the plating department. One employee testified that he smoked there and never had been instructed against it. Thus, there was a demonstrated possibility of ignition of the flammable or combustible mists and vapors by cigarette sparks.

The Court has asked us to consider two other matters: (1) the Court points to an apparent conflict in the testimony of Padden and Doyle with respect to the type of ductwork most commonly used in the ventilation systems of other industrial plating departments; and (2) the Court points out that P & W's scientific testing did not reveal any trace of the dangerous substances the Secretary claimed might form.

Regarding industry ventilation practices, Padden testified that it was not the practice in any of the plants he visited to use separate exhaust ducts flowing into a common duct. In over 400 or 500 visits to 100 or so plants with plating departments in the United States, Padden could not recall any departments that vented acids and cyanides into a common duct. He testified that it was "a very unsafe practice to use a common duct on any type of material that could cause fire or an explosion."

Doyle testified that he had visited "possibly fifteen or twenty plants" that used plating lines similar to P & W's and that some had individual ducts and others had common ducts. However, when asked if he recalled those plants with common ducts, Doyle named one plant that he thought had common ductwork, one that used both kinds of ductwork, and one that he believed had used common ductwork but that he had not visited since the late 1940's. On the basis of Padden's testimony, which we find substantially more compelling, we conclude that the usual practice in the industry was to use individual ductwork. This is hardly surprising in light of the testimony of P & W's own industrial hygienist, Dunstan, noted above, that it was not good practice to vent the chemicals used in P & W's plating lines through a common duct because the

incompatible chemicals could mix, generate HCN, and cause a fire or explosion.[6/]

---

6/ Dunstan specifically testified on direct examination by the Secretary as follows:

> Q: Now, did you have any conversations with Mr. Larsen [OSHA's compliance officer] about the common ductwork used for the various chemicals that we have just discussed?
>
> A: There may have been.
>
> * * *
>
> Q: Did you express any opinion as to whether or not these chemicals should be carried out through a common duct?
>
> A: I may have.
>
> Q: And what would that opinion be?
>
> A: That it would not be good practice.
>
> Q: Why wouldn't it be good practice?
>
> A: Because of intermixing of incompatible materials.
>
> Q: The intermixing of incompatible materials?
>
> A: Yes, sir.
>
> Q: It can cause what?
>
> A: Hydrogen cyanide generation.
>
> Q: Could it also cause a fire hazard?
>
> A: Could be.
>
> Q: Could it also cause an explosion hazard?
>
> A: Could be.

Larsen testified that he asked Dunstan during the inspection why all the plating lines vented into a common ductwork, and "he just shook his head and he said, well, it was a matter of economics. He further stated that this was a poor excuse, but what can I say."

With respect to the testing issue, the fact that the Secretary did not test scientifically for the presence of the allegedly hazardous combinations of substances and that P & W did so and did not detect any such combinations does not invalidate the Secretary's case. The Secretary's case is not premised on the normal occurrence of hazardous combinations. The standard requires no such proof. The standard's purpose is preventative and its protection extends to unusual conditions and infrequent occurrences. Interpreted with the significant risk requirement mandated by the Second Circuit, the standard requires that the Secretary prove that either one or a combination of the substances removed through P & W's common duct system presented a significant risk of a fire, explosion, or chemical reaction hazard in that ductwork. The evidence discussed above and in our earlier decision convinces us that the Secretary has discharged his burden of proof under the standard.

The Secretary proved that there was a significant risk that unusual conditions would indeed occur. That such conditions were only likely to occur infrequently does not provide any reasonable basis for the administrative law judge to suggest that the possibility of their occurrence was so minimal "that the Secretary might just as well have suggested the possibilities of arson or insurrection." Nor does it preclude a finding of noncompliance with the standard under the significant risk test, nor, more importantly, does it diminish the need to prevent such occurrences. The hazardous substances involved here could combine to quickly, perhaps with virtually no warning, bring death or serious physical harm to P & W's employees. It is our conclusion that

the cited standard was drafted to prevent such eventualities; interpreting it to require proof of the actual existence of hazardous chemical combinations in the duct system undermines the standard's preventative purpose and essentially means that a showing of noncompliance with the standard's terms would have to await employee injuries from hazardous chemical combinations.

We have given due weight to the judge's conclusions. However, we find that the evidence that the usual industry practice is to use separate exhaust ducts for the chemicals involved here, the acknowledgment by P & W's industrial hygienist that common ductwork is not good practice and can result in HCN formation as well as fire and explosion hazards, and the testimony of the Secretary's expert outweigh those conclusions.

Accordingly, we reaffirm our earlier decision on the Secretary's section 1910.94(d)(7)(iii) allegation. We also grant the Secretary's motion to withdraw the section 1910.132(a) allegation concerning the failure of the employee operating the "spider" mechanism to wear a hardhat.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: SEP 30 1982

ROWLAND, Chairman, dissenting:

I dissent from the majority's opinion finding that the Secretary proved noncompliance with section 1910.94(d)(7)(iii) under the "significant risk" test required by the Second Circuit. Despite the majority's claim that it is deciding this case in accordance with the terms of the court's remand order, it in reality applies the test rejected by the court, that the likelihood of occurrence of a hazard be merely possible as opposed to significant. As the court specifically stated, "[t]he occurrence of a freakish event constitutes a possibility, but we believe . . . that safety standards may not be so broadly interpreted so as to embrace such slight risks of harm." Pratt & Whitney Aircraft v. Secretary of Labor, 649 F.2d 96, 104 (2d Cir. 1981). Yet in affirming the citation allegation in issue, the majority reasons that the standard applies to "unusual conditions" and "infrequent occurrences," thereby adopting the broad interpretation which the court has expressly disavowed. Furthermore, despite the court's admonition that the Commission evaluate all of the evidence of record, the majority has not given proper consideration to the evidence submitted by P & W in rebuttal to the Secretary's case.

With respect to the Secretary's contention that acid mists and cyanide mists could combine in the common duct to form hydrogen cyanide ("HCN") gas, the majority cites the testimony of the Secretary's expert witness, Padden, who stated that chemical mists would be drawn into the ductwork if the surfaces of the acid or cyanide solutions were agitated. The majority also notes P & W expert witness Doyle's statement that cyanide mists could enter the ductwork if the cyanide solutions were highly agitated. As the majority itself concedes, however, this evidence shows nothing more than a possibility that acids and cyanides could enter the common duct. The majority states, "[w]e find that the solutions could become sufficiently agitated that cyanide mists could be drawn into the ductwork. . . ." (emphasis added). Furthermore, the record does not

contain any evidence about the extent to which the surfaces of the acid and cyanide solutions were agitated during actual plant operations, nor does the evidence show any appreciable likelihood of HCN being formed as a result of agitation of the surfaces of the acid or cyanide solutions. Indeed, P & W's expert, Doyle, testified from personal experience that the cyanide solutions in the tanks only released water vapor and an ammonium compound into the air to be carried into the ductwork above the cyanide tanks. He further testified that any combination of ammonia with acid would produce only a white salt. 1/ Therefore, Doyle concluded that the plating lines did not present a chemical reaction, fire, or explosion hazard. The opinions of highly qualified witnesses who testify from personal experience are entitled to substantial weight. 2/ Kelly Springfield Tire Co., OSAHRC Docket No. 78-4555 (Aug. 27, 1982) (dissenting opinion).

Moreover, the results of P & W 's testing for HCN corroborate Doyle's opinion. Contrary to the majority, those tests results are entitled to weight. There is no evidence from which to conclude that P & W's tests were not taken under conditions representative of actual plant conditions. 3/ See Snyder

---

1/ Dunstan gave similar testimony. See note 3 infra.

2/ Doyle had about twenty years of experience as a chemical engineer, with extensive experience in industrial abatement of chemical hazards. Although the Secretary's expert, Padden, had comparable experience, he did not dispute Doyle's testimony regarding the chemical reactions resulting from the cyanide tanks.

3/ The majority contends that breakdowns in the ventilation system were normal occurrences in P & W's plant and that such breakdowns could create down-drafts, forcing HCN present in the ductwork back down into the plant. However, the record does not demonstrate that ventilation system defects brought about the formation of HCN in the first place. The testimony of employee Champney, cited by the majority, shows only that acid fumes, not HCN, were released into the air when the ventilation system broke down in the plating department. Furthermore, Dunstan, P & W 's industrial hygienist to whom breakdowns in the system were reported, stated that in the event of breakdowns, ammonia vapor released from the cyanide tanks generally would mix with vapors from the acid tanks, thus forming ammonia compounds.

Well Servicing, Inc., 82 OSAHRC 10/C5, 10 BNA OSHC 1371, 1982 CCH OSHD ¶ 25,943 (No. 77-1334, 1982) (concurring and dissenting opinion). As I have previously stated, the burden is on the Secretary to prove by a preponderance of the evidence that there was a significant risk of HCN formation. P & W is not required to prove that there is no such risk.

The majority opinion also asserts that the likelihood of entry of mists into the common ductwork increases as the temperatures of the solutions in the tanks increases. However, other than a reference to the boiling point of the substances in the tanks, which itself is based on an unsupported assumption that the boiling point could be reached, 4/ Padden's testimony about the magnitude of the solutions' temperatures in relation to the increased hazard of HCN formation is nonspecific and conclusory. It is speculative to conclude from his testimony that a significant risk of hazard results from the temperatures to which the tanks were heated.

The majority also concludes that the Secretary proved hydrogen peroxide and heated slushing oil could combine in the common duct to cause a fire or explosion and that hydrogen peroxide and acetic acid could combine to form peracetic acid, which could then combine with oil mists in the common duct to create fire and explosion hazards. I disagree.

Even assuming, as the majority states, that P & W's industrial hygienist Dunstan conceded that hydrogen peroxide and oil entered the common duct, 5/

---

4/ Padden testified that he did not know how much steam was available to the tanks. He could not, therefore, testify whether the steam available was capable of bringing the solutions to boiling. Also, the record does not show that the boiling points of the solutions in the tanks had ever been exceeded.

5/ The only testimony which might support the majority's assertion that Dunstan had so conceded is found in the following answers given by Dunstan upon questioning by the Secretary's attorney:

Q: Now, do you use hydrogen peroxide in the Plating Department?

(Continued)

Dunstan did not state that the mixing of hydrogen peroxide and heated oil would therefore occur. Rather, his testimony was to the contrary. Dunstan stated that there were two tanks of cyanide solution between the hydrogen peroxide and the oil tanks and that as the hydrogen peroxide moved through the common duct it would be decomposed to water by the cyanides before it could even reach any oil. In fact, Dunstan further stated that he tested for the presence of oil in the ductwork and found only a dry residue, indicating that oil was not present in the ductwork. Dunstan also testified that a reaction between hydrogen peroxide and slushing oil would require a temperature of about 390° F. The temperature of the oil, however, was no more than about 300° F., while the hydrogen peroxide was not heated. According to Dunstan, he measured the temperature of the air entering the duct from the oil tank at about 85° F. Based on a measured air flow of about 6000 cubic feet per minute, Dunstan estimated the temperature inside the duct to be only about 90° F. He concluded, therefore, that heated oil and hydrogen peroxide did not present a hazard.

---

5/ (Continued)

A: Yes, sir.

Q: Do you use heated oil?

A: Yes, sir.

Q: Do they go up a common duct?

A: Yes, sir.

The Secretary's attorney never specifically asked Dunstan if hydrogen peroxide and oil did in fact enter the common duct. In view of the generalized nature of the Secretary's questions and Dunstan's answers, this testimony shows nothing more than the fact that a part of the ventilation system included a common duct. As noted in the text of this opinion, when Dunstan did specifically address the question of whether oil entered the common duct, he testified that oil was not present in the common duct.

The Secretary did not rebut Dunstan's testimony. Indeed, the Secretary's own expert witness, Padden, admitted on rebuttal that he did not actually know if hydrogen peroxide or slushing oil entered the common duct. Padden also admitted that a knowledge of the velocities of the exhaust system would have been helpful to him in arriving at his opinion on the likelihood of the occurrence of hazardous chemical reactions. Yet, neither Padden nor the Secretary's industrial hygienist, Larsen, measured the air flow into the duct system. 6/

The majority opinion also finds that the Secretary proved his allegation of hazards stemming from the formation of peracetic acid. Dunstan, however, testified that a temperature between 140°-180° F. is required for the formation of peracetic acid and that it takes some period of time before any appreciable amount of the acid can be developed. Although Larsen claimed that heat was not required to produce peracetic acid, he did concede, as did Padden, that peracetic acid did not present an explosion hazard unless it was heated to 230° F.; Padden stated that the flash point of peracetic acid is 105° F. Yet, as previously noted, Dunstan estimated the duct temperature to be only at about 90° F. Larsen admitted that he had made no determination regarding the temperature in the ducts.

Nevertheless, the majority states that a source of ignition for the chemical substances in the plating department existed from cigarette smoking. The employee on whom the majority relies, however, did not testify that he smoked in the vicinity of the tanks. In fact, the employee testified that he had been instructed against smoking in one particular area of the department. DuPre, P & W's safety engineer, testified that smoking was prohibited at certain tank locations. Also, the fire caused by smoking to which the majority refers occurred about ten years before the hearing of this case. There is absolutely

---

6/ The record does not show any basis for Padden's reference to an exhaust velocity, noted in the opinion of the majority, of 200 feet per minute.

no evidence that any fire had occurred more recently than that.

Accordingly, I conclude the judge properly determined that only a remote possibility of a fire, explosion, or chemical reaction hazard was demonstrated by the Secretary. Since such proof does not establish the "significant risk" required by the court, I would affirm the judge's decision vacating the pertinent citation item. 7/

---

7/ In view of my conclusion that the Secretary failed to demonstrate the existence of a significant risk of hazard, I do not reach the question of whether individual or common ductwork was the practice in the industry. See Kansas City Power & Light Co., 82 OSAHRC 13/A2, 10 BNA OSHC 1417, 1982 CCH OSHD ¶ 25,957 (No. 76-5255, 1982) (dissenting opinion). Therefore, I need not consider whether the majority's conclusion that the industry customarily uses separate ductwork is supported by the evidence.

| v. | : | |
| BROWN & ROOT, INC., | : | |
| Respondent, | : | OSHRC Docket No. 78-127 |
| INTERNATIONAL ASSOCIATION OF BRIDGE, STRUCTURAL AND ORNAMENTAL IRON WORKERS, AFL-CIO, | : | |
| Intervenor. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

An order of Administrative Law Judge Louis G. LaVecchia is before the Commission pursuant to section 12(j), 29 U.S.C § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge LaVecchia approved a settlement agreement submitted by the Secretary of Labor and Brown & Root, Inc. In the settlement, the Secretary moved to amend his citation and complaint to characterize an alleged section 5(a)(1) violation as serious rather than willful and reduce the proposed penalty from $9,000 to $400.

The International Association of Bridge, Structural and Ornamental Iron Workers, AFL-CIO ("Iron Workers"),[1/] filed a petition for discretion-

1/ In early 1978, the Iron Workers sought to intervene and, upon interlocutory appeal of an adverse ruling by the judge, a Commission majority granted the petition for intervention. Brown & Root, Inc., 7 BNA OSHC 1526, 1979 CCH OSHD ¶ 23,731 (No. 78-127, 1979).

ary review asserting that the Iron Workers were not given adequate opportunity to present objections to the settlement proposal. Commissioner Cleary granted the Iron Workers' petition for discretionary review.

The Iron Workers, having been granted intervention status by the Commission, 7 BNA OSHC 1526, 1979 CCH OSHD ¶ 23,731, have a right to be heard on objections to a settlement agreement between the Secretary and an employer that involves the cited hazard to which the employees it represents were exposed. See Mobil Oil Corp., 82 OSAHRC ____, 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982); Englehard Industries, Docket No. 78-2880 (Aug. 30, 1982).[2/] Because the Iron Workers have not been afforded this right, we set aside the judge's order approving the settlement agreement and remand the case for further proceedings consistent with this decision and Commission precedent.[3/] SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: SEP 30 1982

---

2/ Chairman Rowland dissents because, for the reasons explained in his dissenting opinion in Mobil Oil Corp., supra, he believes that the union may object only to the reasonableness of the abatement date, and such an objection cannot be made in this case in which immediate abatement is required. Chairman Rowland does not express any individual views on the union's status in this case because the earlier Commission decision, note 1 supra, is the law of the case. Stripe-A-Zone, Inc., 82 OSAHRC , 10 BNA OSHC 1694, 1696, 1982 CCH OSHD ¶ 26,069 at p. 32,783 (No. 79-2380, 1982) (Rowland, Chairman, concurring).

3/ On June 25, 1982, a Joint Stipulation of Complainant and Respondent was filed with the Commission, stating that "this matter may be re-

(continued on next page)

---

3/ (continued)

manded to the administrative law judge for the sole purpose of permitting the Intervenor . . . its full ten days to comment on only the reasonableness of the abatement date provided in the settlement agreement." On August 24, 1982, the Commission notified the parties and the intervenor that consideration of the Joint Stipulation would be deferred until the Commission considered the disposition of the case.

The limitation contained in the stipulation would frustrate the basis of the Commission's grant of intervention. Furthermore, the limitation is inconsistent with Commission decisions holding that employee interests in settlement proceedings are not limited solely to the resonableness of the abatement period. See Mobil Oil Co., supra, and Englehard Indus., supra. Accordingly, we decline to limit this remand by the conditions set forth in the Joint Stipulation.

ORDER

These consolidated cases are before the Commission for review pursuant to 29 U.S.C. § 661(i). The issues directed for review pertain exclusively to Docket No. 78-250 (Amoco Chemicals Corporation). No party has taken exception to the judge's disposition of No. 78-248 (Standard Oil Company) and no aspect of the case has been directed for review.

Accordingly, the two cases are severed pursuant to Commission Rule 10, 29 C.F.R. § 2200.10. In Docket No. 78-248, the judge's decision is the final order of the Commission. Docket No. 78-250 remains on review.

USHER, Judge:

These proceedings were initiated by the Secretary of Labor, United States Department of Labor, pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 651, et seq. ("the Act"). The Secretary seeks affirmance of two identical Citations (one issued to each of the Respondents) and proposes that penalties totalling $40,000 be assessed. In each Citation the Secretary charges two "willful" violations of the Act. In Item 1 of the Citations, Respondents are charged with violation of Section 5(a)(2) of the Act because of alleged noncompliance with the safety and health standard codified at 29 CFR 1904.2(a),[1/] and in Item 2 Respondents are charged with violation of Section 5(a)(1) of the Act.[2/]

The Citations resulted from an inspection and investigation of Amoco Chemicals Corporation's ("Amoco") plant at New Castle, Delaware, from February 25, 1977, to December 28, 1977, and were issued on December 29, 1977. Respondents filed timely Notices of Contest, and a Complaint and Answer followed in each case in accordance with the Commission's Rules of Procedure. The issues were tried before me at Philadelphia, Pennsylvania on September 5 and 6, and October 24, 25 and 26, 1978. The Oil, Chemical and Atomic Workers International Union elected party status pursuant to Commission Rule 20(a) and participated fully.

---

1/ Part 1904 of Title 29, Code of Federal Regulations, is entitled "Recording and Reporting Occupational Injuries and Illnesses," and at subsection 1904.2 the following requirement is noted:

> Log and summary of occupational injuries and illnesses.
>
> (a) Each employer shall, except as provided in paragraph (b) of this section, (1) maintain in each establishment a log and summary of all recordable occupational injuries and illnesses for that establishment; and (2) enter each recordable injury and illness on the log and summary as early as practicable but no later than 6 working days after receiving information that a recordable injury or illness has occurred. For this purpose form OSHA No. 200 or an equivalent which is as readable and comprehensible to a person not familiar with it shall be used. The log and summary shall be completed in the detail provided in the form and instructions on form OSHA No. 200.

2/ Section 5 of the Act provides:

> (a) Each employer—
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;
> (2) shall comply with occupational safety and health standards promulgated under this Act.

The parties have stipulated the following issues: Amoco, a corporation with its principle offices in New Castle, Delaware, employs approximately 350 employees and manufactures products which are sold in interstate commerce; Standard Oil Company of Indiana ("Standard") is a corporation with principle offices in Chicago, Illinois, and is engaged in the sale of petroleum products on a nationwide basis. Amoco, a wholly owned subsidiary of Standard, has owned and operated the New Castle, Delaware, plant from 1968 until the present; Amoco's medical department is responsible for implementing corporate policy set forth by Standard. The parties also stipulated that the several depositions taken prior to the trial would be used to the extent necessary at the trial.

Complainant, Respondent (Amoco) and the Union have filed post-trial briefs, and Respondent has filed a reply brief.

The Issues.

The following issues are raised by the pleadings, the evidence adduced, arguments of counsel, and the post-trial briefs:

1. Whether the Secretary's action in issuing the Citations is barred by Section 9(c) of the Act and the statute of limitations contained therein.

2. Whether Standard is a proper party to this action.

3. Whether Respondents, or either of them, violated the Act as alleged in the Complaint.

4. If Respondents, or either of them, violated the Act, were the violations "willful" in nature.

5. Are the proposed penalties, or any penalties, appropriate.

In Item 1 of each of the Citations Complainant has charged a violation of Section 5(a)(2) of the Act because of alleged noncompliance with the safety and health standard promulgated by Complainant and codified at 29 CFR 1904.2(a) in that:

> The log of occupational injuries and illnesses (OSHA Form No. 100 [sic] or its equivalent) was not completed in the detail provided in the form and the instructions contained therein:
>
> (a) Illnesses arising from occupational exposure to asbestos (asbestosis/asbestos disease) were not recorded.

A violation of Section 5(a)(1) of the Act is charged in Item 2 of the Citations as follows:

> An employee was required to work, after the employer's diagnosis of a serious medical condition (pleural effusion), under conditions which were likely to cause death or serious physical harm.

Abatement of these conditions was ordered immediately, and Complainant proposed that penalties of $20,000 be assessed against each Respondent.

The Statute of Limitations.

Respondents contend that the provisions of Section 9(c) of the Act bar enforcement of the Citations. I cannot agree. Section 9(c) provides that:

> [n]o citation may be issued under this section after the expiration of six months following the occurrence of any violation.

Respondents maintain that the two violations occurred, if at all, when the records were not properly kept, as charged in Item 1 of the Citations, and when the employee was not told of his condition as charged in Item 2. In Secretary of Labor v. Yelvington Welding Service, OSHRC Docket No. 15958, CCH OSHD ¶23,092 (1978), the Commission held that these types of violations are by their nature ongoing breaches of the employer's duty. It is patent logic that if a regulation requires that an act be done, the infraction occurs as long as the act is not done.

Further, Respondents argue that the Citations are barred because the Secretary should have found and cited the alleged violations at the start of the inspection, and since the inspection was longer than the six-month limitation period the Citations must be vacated. Respondents have offered no evidence of prejudice resulting from the length of the inspection and investigation. Complainant asserts, on the other hand, that the complex nature of the factual and legal questions involved made it impossible to determine until much later whether a violation or violations should be charged.

I am persuaded by Complainant's arguments and assertions. The question at the time of the investigation was not whether Respondents complied with the regulations, but rather whether they should have done so. Such a determination is not prone to summary ascertainment. Absent a showing of prejudice by Respondents, and considering the ongoing nature of the violations, Complainant's delayed action or restraint in the issuance of the Citations cannot support a determination that the limitation specified in Section 9(c) of the Act should apply.

The Proper Party.

Respondents contend that Standard is not a proper party. At the close of Complainant's case counsel for Respondents moved for (among other things) dismissal of

the Complaint and vacation of the Citation against Standard on the ground that Complainant had failed to prove Standard's liability as an employer of the allegedly affected employees. For the reasons which I stated at the time, the Citation against Standard was summarily vacated, and the Complaint against Standard was dismissed (Tr. 264). Complainant admitted that the only allegation against Standard was that it monitored the medical practices used by Amoco at its New Castle plant (Tr. 263). It was proved that Standard and Amoco were distinct and separate corporate entities, that Standard acted only as a consulting firm might have, and that it employed none of the employees involved (Tr. 263-264). There was no testimony to substantiate a finding of violation by Standard. Complainant's subsequent motion for a reconsideration of that ruling was carefully considered and denied by Order, dated December 18, 1978.

Violation of the Act by Amoco.

Respondent is charged with violation of Section 5(a)(1) of the Act, the so-called "general duty clause." To establish liability under that section, "the Secretary must prove (1) that the employer failed to render its workplace 'free' of a hazard which was (2) 'recognized' and (3) 'causing or likely to cause death or serious physical harm'," National Realty and Construction Company, Inc. v. OSHRC, et al. 489 F.2d 1257 (D. C. Cir. 1973). (See also Titanium Metals Corporation of America v. Secretary of Labor, et al., 579 F.2d 536 (9th Cir. 1978)). The establishment of a recognized hazard requires proof either that the employer had actual knowledge of the hazard or that accepted industry standards recognize it as a hazard. (Brennan v. OSHRC, et al., 494 F.2d 460 (8th Cir. 1974)). A condition or practice "likely to cause death or serious physical harm" has been defined as one which "...could eventuate in serious physical harm upon other than a freakish or utterly implausible concurrence of circumstances..." Titanium Metals, supra, at 541. This reasoning is reinforced by the rule that an accident need not actually occur in order to establish a violation of Section 5(a)(1) of the Act, and death or serious physical injury need not actually result before a "serious" violation can be established. (Brennan v. Butler Lime & Cement Company, et al., 520 F.2d 1011 (7th Cir. 1975)).

The general duty violation involved Louis Kofron, an Amoco employee at the New Castle plant. H. Thomas McGuire, M. D., the plant physician for Amoco since it began its operations at the New Castle plant in 1968, testified that Kofron's X-ray evidenced a pleural effusion (Tr. 336). Information concerning that finding was never transmitted to Kofron, even after two subsequent X-rays evidenced the same condition (Tr. 336, 50). It is

clear from the record that Dr. McGuire recognized the significance of that omission and the hazard it presented. He testified that standard medical practice would dictate that a patient with a history of asbestos exposure whose X-ray gave evidence of a pleural effusion should have been diagnosed immediately (Tr. 338). A biopsy is ordinarily performed to determine if the condition is benign or malignant.

Kofron worked for two years thereafter without any restrictions on his employment by Amoco before he became aware of the pleural effusion (Tr. 50). He eventually consulted his personal physician and was immediately hospitalized (Tr. 50). After a biopsy was performed it was determined that the growth was benign, and it was removed. (Tr. 50).

There is abundant evidence that Respondent had knowledge of the potential for hazard to Kofron and recognized the possible urgency of the employee's condition. But for the fortuitous development of a benign growth (rather than a malignant one), the employee may have been suffering from a terminal illness, and Amoco's callous attitude may well have contributed to that condition. Amoco thoughtlessly squandered Kofron's chances for early detection of cancer. The "employee was required to work, after the employer's diagnosis of a serious medical condition (pleural effusion), under conditions which were likely to cause death or serious physical harm." The violation of Section 5(a)(1) of the Act was proved, and the violation is properly characterized as "serious" in accordance with Section 17(k) of the Act.

Regarding the alleged violation of the recordkeeping regulation promulgated under Section 6 of the Act and codified at 29 CFR 1904.2, there is no dispute that the employees' illnesses (asbestos disease or asbestosis) were not recorded on the designated Occupational Safety and Health Administration ("OSHA") forms. Respondent contends that it was not required to report these illnesses because there was never a "diagnosis" of asbestosis. It argues that without a confirmed diagnosis it was impossible to establish that the illness was occupationally related, and the standard requires that only occupational illnesses be recorded on the OSHA forms.

Complainant presented an array of competent and persuasive witnesses. Ruth Lilis, M. D., a professor of medicine at the Mount Sinai Hospital School of Medicine in New York City, has long worked in the field of industrially induced lung disease (Tr. 25). Dr. Lilis has conducted some four to five thousand case studies in asbestosis (Tr. 27), and has achieved the highest grade possible for an X-ray reader (Tr. 27). She testified that there are three essential elements for a diagnosis of asbestos disease, i.e., a history of

asbestos exposure, a positive chest X-ray, and changes in pulmonary function (Tr. 46). She contended that no biopsy is needed for a diagnosis; a chest X-ray would clearly show when the disease is diagnosable (Tr. 46-47). After interviewing and examining 12 of Respondent's employees, Dr. Lilis diagnosed seven patients as having asbestosis (Tr. 74-77, 79).

Lawrence Fine, M. D., a recognized expert in the field of occupational disease, agreed that asbestosis can be diagnosed from an occupational history of exposure to the substance and a complete physical exam, including X-rays (Tr. 153). A biopsy would be helpful where otner factors are confusing, but it is not necessary for a diagnosis, according to Doctor Fine (Tr. 154). After studying the results of the pulmonary function tests and the X-rays of 10 of Respondent's employees, Doctor Fine determined there were four cases of asbestosis among them (Tr. 186-187), and two employees presented other cases suggestive of asbestosis (Tr. 188). Doctor Fine was able to make these diagnoses using the company's own records (Tr. 228).

Doctor Alfred Fishman, a professor of medicine at the University of Pennsylvania Hospital, was hired by Respondent to conduct pulmonary function tests on 220 of Respondent's employees. Doctor Fishman (in an oral deposition) testified that in his professional opinion he could not prove a diagnosis of asbestosis without a biopsy (Dep. 18). He never reported any diagnoses to Respondent; that was not, according to his testimony, the object of his survey (Dep. 4, 17). However, in his view the results he reported to Respondent raised a strong suspicion of asbestosis (Dep. 17).

Respondent claims that at no time was there a diagnosis of asbestosis reported to it. Nevertheless, it is clear from the record that Respondent's physicians had obtained all the information essential to a diagnosis of asbestosis. Whether the diagnosis was absolutely proven by biopsy is unimportant. One purpose of a reporting statute is to serve as an early alert to the end that a pattern of occupational illnesses can be identified and avoided. Respondent has attempted to contravene both the letter and intent of the statute. A violation of Section 5(a)(2) of the Act has been proven. Respondent failed to comply with the requirements of the reporting standard; and that failure created a substantial probability of death or serious physical harm to its employees. The violation was "serious" in nature.

Willfulness.

In both items of the Citation Complainant alleged that Respondent willfully violated the Act. The Review Commission has consistently held a violation is willful when the action is conscious, intentional, voluntary, and deliberate, regardless of venal motives.

Secretary of Labor v. Georgia Electric Company, OSHRC Docket No. 9339, CCH OSHD § 21,613 (1977) and cases cited therein.[3/]

Respondent's reliance upon Frank Irey, Jr., Inc. v. OSHRC, et al., 519 F.2d 1200, is inappropriate in light of the Court's recent pronouncements in The Babcock & Wilcox Company v. OSHRC, et al., _____ F.2d _____ (3rd Cir., May 15, 1980). There the court carefully pointed out that "an 'intentional disregard of OSHA requirements' differs little from an 'obstinate refusal to comply'; nor is there in context much to distinguish 'defiance' from 'intentional disregard'."

Respondent knew of Kofron's pleural thickening and knowingly made the decision not to inform him about his condition or restrict his employment so as to prevent the possible worsening of that condition. In the second situation, Respondent had all the information necessary to make a diagnosis, yet it intentionally omitted all information from the appropriate OSHA forms. Under these circumstances Respondent's violations of the Act were "willful" as that term is used in Section 17 of the Act. In each instance the Company recklessly disregarded the consequences of its acts. The "general duty clause" violation involving Kofron was nothing less than an "obstinate refusal" to assure that employee employment and a place of employment free from a recognized hazard which was causing or was likely to cause him serious physical harm or likely to cause even his death. Respondent has offered no plausible explanation for its failure to inform the employee of his condition or its failure and refusal to restrict his employment activities in order to lessen the possibility of a worsening of that condition. Considering the possible consequences of its actions (or inaction) Respondent evidenced an "intentional disregard" for the employee's health and safety.

The record reflects an equally unconscionable attitude by Respondent regarding the other employees who did in fact suffer from asbestosis, but whose illnesses were not formally diagnosed. Respondent's failure and refusal to make the diagnoses when it had sufficient information to do so amounted to a defiant and reckless disregard for the precautionary requirements of the safety and health standard. It was only the absence of these diagnoses and the asserted uncertainty of the job-relatedness of the illnesses that provided the lame excuse for not reporting them. Respondent — and only Respondent — possessed the information at that time to make the diagnoses, and it obstinately refused to do so.

---

3/ Aff'd. 595 F.2d 309 (5th Cir. 1979).

Regardless of whose definition is applied, Respondent's actions were willful, as that term is used in the Act.

The Penalties.

Giving due consideration to the requirements of Section 17 of the Act, I find the proposed penalties reasonable.[4/]

## FINDINGS OF FACT

1. Respondent, Amoco Chemicals Corporation, employs approximately 350 persons at its New Castle, Delaware plant, and goods produced there are sold in interstate commerce.

2. The violations alleged in the Citation are by their nature continuous, and they did in fact continue.

3. The violations alleged in the Citation were not found by the Secretary until sometime during the inspection of Amoco's work site.

4. Respondent, Standard, employed none of the employees who were affected by the violations at Amoco's New Castle, Delaware plant.

5. Respondent, Amoco, had knowledge of its employee's medical condition, viz., pleural effusion, but did not inform him of his condition or restrict his employment to prevent the possibility of a degeneration of his health.

6. Respondent, Amoco, possessed all the facts necessary for a diagnosis of asbestosis, but did not diagnose it, label it as an occupational illness suffered by its employees, or record it on the appropriate OSHA forms.

7. Respondent, Amoco, made a conscious, deliberate and knowing decision to avoid its responsibilities under the Act, and its conduct amounted to a defiant and reckless disregard for the provisions of the Act.

---

4/ Section 17 of the Act:

> (a) Any employer who willfully or repeatedly violates the requirements of Section 5 of this Act, any standard, rule, or order promulgated pursuant to Section 6 of this Act, or regulations prescribed pursuant to this Act, may be assessed a civil penalty of not more than $10,000 for each violation.
>
> ***
>
> (b) The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

## CONCLUSIONS OF LAW

1. Jurisdiction of the parties and subject matter herein is conferred upon the Occupational Safety and Health Review Commission by Section 10(c) of the Act.

2. At all times relevant hereto Respondent was an employer engaged in a business affecting interstate commerce, within the meaning of Section 3(5) of the Act, and as such was subject to the requirements of Sections 5(a)(1) and 5(a)(2) of the Act.

3. Respondent, Standard, is not a proper party to this action.

4. The statute of limitations set forth in Section 9(c) of the Act does not bar Complainant's action.

5. Respondent, Amoco, violated Section 5(a)(1) of the Act by its failure to provide a safe workplace for at least one of its employees.

6. Respondent, Amoco, violated Section 5(a)(2) of the Act by not complying with the safety and health standard codified at 29 CFR 1904.2, i.e., by its failure to record an occupational illness on proper OSHA forms.

7. Respondent's violations set forth above were "willful" in nature.

## ORDER

Upon consideration of the foregoing findings and conclusions, it is hereby ORDERED that the Citation issued to Respondent, Standard Oil Company of Indiana, is VACATED; the Citation issued to Respondent, Amoco Chemicals Corporation, is AFFIRMED. A penalty of $20,000 is ASSESSED against Amoco Chemicals Corporation.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>TEXACO, INC.,<br><br>Respondent.<br><br>OIL, CHEMICAL AND ATOMIC WORKERS INTERNATIONAL UNION AND ITS LOCAL 4-23,<br><br>Authorized Employee Representative. | OSHRC Docket No. 78-737 |

DECISION

Before: ROWLAND, Chairman; CLEARY, Commissioner. */

BY THE COMMISSION:

An order of Administrative Law Judge Erwin L. Stuller approving a settlement agreement between the Secretary of Labor and Texaco, Inc., is before the Commission for review. The judge held that the Oil, Chemical and Atomic Workers International Union and its Local 4-23 ("the Union") were not entitled to an evidentiary hearing on certain objections they raised to the agreement. Commissioner Cleary directed review of the judge's decision pursuant to section 12(j) of the Occupational Safety and Health Act of 1970 (29 U.S.C. § 661(i)). The principal issue on review is whether an employee party can object to provisions in a settlement agreement between the Secretary of Labor and a cited employer wherein the Secretary agrees to withdraw contested items of a citation.

The two participating members are divided on the disposition of this case. Chairman Rowland would affirm the judge's ruling on the ground that the

---

*/ Commissioner COTTINE took no part in the consideration or decision of this case.

Commission lacks authority to consider employee objections that are not related to the abatement period. Mobil Oil Corp., 82 OSAHRC ___, 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982) (dissenting opinion). Chairman Rowland agrees with Texaco's argument that the Secretary's decision to withdraw the three items at issue eliminates from any possible controversy the one point on which an employee party should be permitted to object to a settlement agreement. 1/ Commissioner Cleary would vacate the judge's order and hold that the Commission has jurisdiction to consider the Union's substantive objections to the settlement agreement. For the reasons stated in his concurring opinion in Mobil Oil Corp., supra, Commissioner Cleary would hold that under section 10(c) of the Act affected employees who have elected party status must be afforded the opportunity to review and raise objections to settlements proposed by the other parties, including objections to matters other than the abatement period specified in a settlement proposal.

In view of the divided vote on the merits of the case, Chairman Rowland and Commissioner Cleary agree to dispose of the case by vacating the direction for review. Baldwin Industries, Inc., 82 OSAHRC __, 10 BNA OSHC 1572, 1982 CCH OSHD ¶ 25,980 (No. 78-741, 1982), appeal filed, No. 82-7178 (11th Cir. May 28, 1982).

Accordingly, the direction for review is vacated and the judge's order is the Commission's final disposition of this case.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: SEP 30 1982

---

1/ Under the settlement agreement, a fourth item is to be affirmed and a detailed plan for the abatement of that violation is to be implemented. Nevertheless, the Union has expressly agreed to the settlement agreement's disposition of that citation item, including the abatement period established by the agreement.

## DECISION

Texaco Inc. has been charged with four violations of the Occupational Safety and Health Act. The charges are contained in a citation that was issued on January 26, 1978. Texaco contested the citation. After the complaint was filed, the authorized representative of the affected employees, the Oil, Chemical and Atomic Workers International Union (OCAW), elected party status. They did not file a pleading.

The case was called to trial on June 6, 1978. It was then continued to July 13, 1978.

At the hearing, the Secretary and Texaco announced that they had reached a basis for the settlement of all issues. All of the parties agreed to the settlement provisions for Item 1 of the citation.[1/] As to the three remaining items, the Secretary and Texaco agreed that prosecution of these items would be withdrawn and moved that the items be vacated. OCAW objected.

OCAW argues that once they elect party status and indicate that they are interested in prosecuting the complaint, no part of the citation or complaiant can be vacated without their approval. They believe that they must be allowed to prosecute the Secretary's citation and complaint when the Secretary refuses to do so.

In his brief, the Secretary cites one case to support his position: Secretary of Labor v. Southern Bell Telephone and Telegraph Co., 77 OSAHRC 83/D1, 5 BNA OSHC 1405, 1977-78 CCH OSHD para. 21,8040, (No. 10340, 1977.). In that case the Commission held that only the Secretary has enforcement power under the Act. The exclusiveness of this power does not allow the affected employees to take over the prosecution or force the Secretary to prosecute. The affected employees do not have the right to prosecute citations. They have no standing to contest the Secretary's withdrawal of a citation. Apparently, in an employer contest, the employees' rights as a party may be exercised only if the other parties wish to go forward with the case. Therefore, OCAW's objection to the withdrawal of three items of the citation is overruled.

OCAW has also requested an order that would require "the Secretary to consult with the authorized employees representative before amending any citations or making any settlement offers in all cases with Texaco Inc., at their facility (Port Arthur, Texas)". This order was requested because there are several such cases presently pending before judges of this Commission. OCAW is fearful that the Secretary may attempt to settle these cases without their assistance or approval.

I do not have the authority or power to require the Secretary to consult with OCAW at any time. They cannot be forced to consult with OCAW, either before or after consulting with the employer, in this or any other case. Therefore, their motion to require consultations is denied.

Although Texaco had argued its position at the hearing, it has not yet had an opportunity to file briefs in this matter. Due to the urgency of the issues, this case will be decided and forwarded to the Commission without first considering Texaco's arguments.

## ORDER

The characterization of the violation alleged in Item 1 is amended from "Serious" to "Nonserious". The abatement provisions and abatement date of the item are stricken and those provisions contained in parties' Settlement Agreement is substituted in their place as if repeated here word for word. Item 1, as amended, is AFFIRMED. The proposed penalty of $1000 is VACATED.

Items 2, 3, and 4 of the citation and the related proposed penalties are VACATED.

Erwin L. Stuller

ERWIN L. STULLER
Judge

DATED: August 28, 1978

## FOOTNOTE

1/ Pertinent provision of the Settlement Agreement for Item 1 of the citation, beginning on page 6 of Transcript of Proceedings, is as follows:

> (A) Item 1 of the Citation will allege a non serious violation of 29 CFR 1910.95(b)(1), with no penalty against Respondent.
>
> * * * *
>
> (4) Respondent will retain the services of a qualified engineering consultant to advise Respondent with respect to potential engineering controls available to reduce noise levels. Respondent represents it already has obtained services of such a consultant.
>
> (5) Respondent agrees to implement engineering controls which are now feasible, in an attempt to reduce sound levels in Respondent's P&S Building (barrel painting facility) to within the levels of Table G-16 or as low as is feasible if it is not possible to reduce levels to within limits of Table G-16.
>
> (6) Respondent agrees to implement feasible administrative controls to regulate employee contact with noise conditions present in Boiler House No. 6.
>
> (7) Respondent represents that its affected employees are currently using and will continue to use, and that Respondent is currently enforcing and will continue to enforce, the use of personal hearing protection by the affected employees during the period of implementation of said engineering and administrative controls, and that other times, when employees are exposed to noise levels in excess of Table G-16.
>
> (8) Respondent agrees within 60 days to submit a proposed plan of feasible engineering and administrative controls of noise control measures to the Area Director, Houston, Texas, that will be implemented to abate the violations alleged in Item 1 of the non serious violation issue, January 26, 1978.
>
> (9) Within 40 days after submission of an abatement plan to the Area Director, Occupational Safety and Health Administration, Houston, Texas, Respondent agrees to complete feasible administrative or engineering controls in order to abate the violations alleged in Item 1 of the citation issued January 26, 1978.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>JOSAM MANUFACTURING COMPANY,<br><br>Respondent,<br><br>INTERNATIONAL MOLDERS AND ALLIED WORKERS UNION, AFL-CIO, LOCAL 453,<br>Authorized Employee Representative. | ) | OSHRC DOCKET NO. 78-1448 |

ORDER

This case is before the Commission for review on the merits pursuant to 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678. On September 16, 1982, the Secretary and the Respondent filed a Stipulation and Settlement Agreement for approval by the Commission in which the Secretary withdraws the citation and each party agrees to bear its own fees and expenses. The accompanying letter from the Secretary states that a copy of the agreement "has been posted for the benefit of employees."

The record indicates that the International Molders and Allied Workers Union, AFL-CIO, Local 453, the Authorized Employee Representative of affected employees, previously elected party status and participated at the hearing in this case. There is no indication in this record that the union party was afforded an opportunity to participate in the settlement proceedings or was served with the agreement in accordance with Commission Rule 100(c), 29 C.F.R. § 2200.100(c). See Whirlpool Corp., OSHRC Docket No. 78-3930 (Sept. 30, 1982), and cases cited.

In the past, when presented with a motion for approval of an agreement that has not been properly served on affected employees, the Commission has denied the motion without prejudice, subject to reconsideration upon receipt of adequate proof of service. However, principles of judicial economy dictate a different course in this case. Our review of the record indicates that the terms of the agreement are otherwise consistent with the purposes and provisions of the Act and the criteria for approval of settlements set forth in Commission Rule 100, 29 C.F.R. § 2200.100. Furthermore, our initial review of the record suggests that the disposition of the citation in issue would not differ from that proposed by the Secretary and the Respondent were we to proceed with consideration of the merits of the case.

In order to afford the Authorized Employee Representative its participatory rights, we conclude that the Stipulation and Settlement Agreement shall be approved unless within 13 days[1/] from the issuance of this Order the Authorized Employee Representative indicates an objection to the agreement and requests that its objections be heard. The Executive Secretary shall serve this Order and the attached agreement on the Authorized Employee Representative.

SO ORDERED.

FOR THE COMMISSION

DATED: SEP 30 1982

Ray H. Darling, Jr.

DECISION AND ORDER

LaVecchia, Judge

STATEMENT OF THE CASE

This is a proceeding under section 10(c) of the Occupational Safety and Health Act of 1970 (29 USC 651 et seq.). Respondent seeks review of a citation issued against it by the Occupational Safety and Health Administration.

Based on inspections conducted during the period November 11, 1977 through February 9, 1978 respondent was cited for a serious violation of the health standard set forth at 29 CFR 1910.95(b)(1) dealing with excessive noise levels. A hearing was held on October 16, 1979 at Chicago, Illinois.

Respondent's factory is in Michigan City, Indiana, where it manufactures plumbing and drainage equipment. Frederick Boelter, an industrial hygienist with OSHA's Regional Technical Support Office, visited respondent's foundry on June 8, 1979 in the course of discovery proceedings. His purpose was to review the areas that were under citation. (Tr. 10, 11).

The cleaning room contained five booths, consisting of 3-sided enclosures, along the north wall. At another table, farther to the east, employees were working on interceptors. Along the south wall there were two 30-inch stand grinders, among others. (Tr. 11).

Next to the cleaning area was an area containing a line of six to eight jolt squeeze machines. The witness specifically viewed the cited machine (No. 324). (Tr. 11).

There was a shakeout area northeast of the jolt squeeze area. This was a deck approximately three feet square. Two lines known as the east and west wings fed the molds into the area. The molds were then manually pushed off the conveyor lines onto the shakeout. (Tr. 12).

In the squeeze molder area an employee was making small molds weighing 20 to 35 pounds at the rate of one every 75 seconds. Sand used in the operation was compacted by a jolting action, followed by a squeezing action. (Tr. 15). The noise sources involved were (1) the jolting, in which the table hits against an anvil; and (2) shaking of the pattern vibrator. Carryover noise from other sources was not found to be excessive. (Tr. 14).

The citation showed noise levels in the squeeze molder area between 80 dBA and 110 dBA, with a weighted mean of 93.4 dBA. The witness found vibrator noise of up to 104 dBA. The noise levels in this area were greater than 90 dBA. (Tr. 25). The shakeout table without any castings on it created noise of nearly 96 dBA. When the molds are placed on the table and shaken the noise increases. (Tr. 17). Five employees used in the shakeout operation are those most severely exposed to the noise. (Tr. 19).

The chipping area was about 60 feet long by 25 feet wide, with a ceiling 12 to 15 feet high. Five booths were on the north wall. A free-standing bench created a sixth work station. Several stand grinders were on the south side. (Tr. 23).

The work benches were of steel frame construction. Some had wood tops. (Tr. 23, 31-32)(Ex. C-1A, 1C). Acoustical material had been put on the walls but had deteriorated. (Ex. C-1A, 1B).

Employees used pneumatic chipping hammers and pneumatic grinders to finish and remove defects from the castings. The tools were noisy, showing as high as 96 dBA. Some of the castings radiated additional noise. One of the grinders was new and quieter. (Tr. 23).

The noise carried over from one booth to another, adding to each employee's total noise exposure. (Tr. 23).

The witness was of the opinion that the noise in the chipping area could be significantly reduced by at least three to five dBA. This would be accomplished by using newer, quieter tools or retrofitting the old ones. Kits for retrofitting are available from tool manufacturers; and quieter tools are on the market. (Tr. 23, 24). Employees could be better isolated at their respective work stations. (Tr. 24).

The citation showed noise in the chipping area ranging from 90-115 dBA, with a weighted mean of 102.3 dBA. The witness measured levels of up to 120 dBA in this area.

With respect to the squeeze molding operation the witness stated that other foundries have made use of quiet type vibrators, and they have also used polyurethane pads between the anvil and table. These methods have successfully controlled the noise. (Tr. 14).

To reduce noise from the shakeout, it could be partially enclosed on all sides. A pneumatic-actuated cylinder could be used to push the molds off the east and west conveyor rings onto the shakeout table. (Tr. 18).

The witness found the shakeout system in use at respondent's foundry to be obsolete when compared to other foundries. (Tr. 20). The noise in the shakeout area was measured at 96 dBA. (Tr. 17).

Respondent uses earplugs in its foundry, but there is no hearing protector that will sufficiently reduce noise levels at the inner ear to 90 dBA. Any noise attenuation from earplugs depends upon proper fitting and also upon frequency of the noise. (Tr. 28). The wearing of earplugs was not enforced. (Tr. 89).

Respondent has no hearing conservation program and does not give annual audiometric examinations. (Tr. 87-89). It does not monitor or enforce the wearing of hearing protection. (Tr. 89).

The witness had personally observed several foundries that employ better noise control techniques. (Tr. 29).

## Discussion

The facts are essentially undisputed. Respondent's main contention is that economic feasibility of the proposed remedial measures has not been shown by the complainant. It also questions the absence of the testimony of the inspecting compliance officer. Complainant showed that he was no longer in the employ of the government and was not available for the hearing. If the violation charged had been of a transitory nature, respondent's position might be considered valid, but here the violation is of a continuing nature. This is the type of violation especially suited to discovery proceedings, and the subsequent re-entry of the OSHA industrial hygienist was not without precedent, for the purpose of verifying the findings of the compliance officer and for the opportunity of remedial inspection. Reynolds Metals Co. CCH OSHD para. 20,214 (1975-76), reversed on other grounds CCH OSHD para. 23,137 (1978). Prior rulings adverse to respondent's position during the hearing are affirmed.

The mean noise levels shown in the citation, i.e., above 90 dBA for the squeeze molder, shakeout, and chipping areas, were confirmed by the OSHA expert when he visited the foundry more than a year later. Based upon his experience, the expert testified that controls were feasible. In the squeeze molder area quiet vibrators and polyurethane padding could be used. (Tr. 14). The shakeout could be partially enclosed and lined with fiberglass. It could be converted to semi-automatic operation to reduce the number of employees in the area. (Tr. 18, 22). As an alternative, a quieter shaker could be purchased. (Tr. 21) In the chipping area, quiet tools and improved construction of acoustical booths would achieve a reduction. (Tr. 23, 24).

The abatement measures recommended might not necessarily bring the noise levels within the limits of the standard, but this does not obviate the necessity for using controls. If the controls lead to any reduction at all in noise levels they must be employed. General Electric Co., CCH OSHD para. 21,095 (1976).

Even though controls may be expensive and increase production costs they may be economically feasible. Turner Co. v. Secretary of Labor, 561 F. 2d 82 (7th Cir. 1977). Although the citation in that case was vacated because abatement was not shown to be economically feasible, respondent in that case had an effective hearing conservation program which afforded alternative protection to its employees, and no hearing loss had been shown. In the instant case, respondent had no hearing conservation program, and had done no audiometric testing at all. At any rate, the expert testified that several simple and economical means existed to achieve a significant reduction in noise levels. He stated that new vibrators would cost about $50 apiece, and polyurethane for new acoustical booths would cost about $10 per booth. The respondent's contentions must be rejected.

The violation charged was properly categorized as "serious" within the meaning of the Act (29 USC 666(j)) since the end result of employees being exposed to excessive noise levels would be loss of or damage to hearing. The absence of an effective hearing conservation program added to the problem. An employee showing incipient hearing damage could continue to work in the noisy environment until the condition became total.

The abatement date and penalty were reasonable. One year is sufficient time to permit respondent to bring its operations in the foundry into compliance with the standard. The proposed $640 penalty is in line with the criteria found in 29 USC 666(i)).

## Findings of Fact

1. Respondent operates a foundry at Michigan City, Indiana.

2. Certain areas of the foundry (squeeze molder, shakeout, and chipping) are in violation of the health standard found at 29 CFR 1910.95(b)(1), in view of the excessive noise levels to which certain employees were exposed.

3. Respondent had no hearing conservation program, conducted no audiometric testing, and did not enforce the use of earplugs in areas where excessive noise levels existed.

4. Technologically feasible measures for controlling the excessive noise levels were available to respondent.

5. Economically feasible measures for controlling the excessive noise levels were available to respondent.

## Conclusions of Law

1. At times material hereto respondent was an employer within the meaning of section 3(5) of the Act, engaged in a business affecting commerce.

2. The Review Commission has jurisdiction.

3. The respondent violated the health standard set forth at 29 CFR 1910.95(b)(1).

4. The violation was "serious."

5. The penalty assessed below is reasonable and appropriate.

## ORDER

1. The citation, as amended, is AFFIRMED.

2. A civil penalty of $640 is assessed.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor and General Motors Corporation ("GM") submitted to Administrative Law Judge Joe D. Sparks a settlement proposal for approval. Judge Sparks approved the settlement, finding a lack of objection from the United Automobile, Aerospace & Agricultural Implement Workers of America, Local 296, the authorized representative of the affected employees. Inasmuch as we are unable to find on this record that the union, which objects to the settlement, was afforded either the opportunity to participate in the settlement negotiations or received the notice of the settlement proposal to which it was entitled under the Commission's rules, we remand for further proceedings.

Shortly after a hearing was first scheduled, a union representative notified the Commission that he "wish[ed] to participate in the hearing . . . ." Judge

Sparks notified the Secretary and GM of the union's election of party status. About two weeks later, Judge Sparks cancelled the hearing because the Secretary and GM had represented to him that a settlement had been reached. A settlement proposal was later filed with the judge. Although it stated that "[GM] agrees that notice of this settlement has been posted to the affected employees," it was not accompanied by a certificate that the settlement had been served on the union. After Judge Sparks approved the agreement, review of the judge's decision was directed, in part, on whether the union had been "afforded the opportunity for meaningful participation in the settlement process in accordance with Rule 100(c) of the Commission's Rules of Procedure, 29 C.F.R. § 2200.100(c) . . . ." 1/

The union and GM have since submitted affidavits in response to the direction for review. The affidavit of Mr. Richards, the union's safety and health representative, states that "the Union did not have an opportunity to be a party [to] this agreement nor did the Union have any knowledge that an agreement was in the process of being consummated." The affidavit of Mr. Hoover, the administrator of safety and security at GM's Terex division, states that during his frequent contacts with union officials, they did not inform him of objections to the settlement. The affidavit also states that the settlement agreement had been posted and that GM's attorneys had served Mr. Richards with the settlement proposal. The cover letter to Mr. Richards stated that "[e]nclosed for your records is a copy of the stipulation and settlement agreement . . . ."

---

1/ Commission Rule 100(c) states:

> Rule 100 Settlement.
>
> * * *
>
> (c) Filing; service and notice. When a settlement proposal is filed with the Judge or Commission, it shall also be served upon represented and unrepresented affected employees in the manner prescribed for notices of contest in §2200.7. Proof of service shall accompany the settlement proposal. A settlement proposal shall not be approved until at least 10 days following service of the settlement proposal on affected employees.

The Secretary states that "[i]t is not clear that the terms of Rule 100(c) were in fact strictly followed . . . . If it appears that the [union] was not afforded the opportunity for meaningful participation in the settlement process, a remand would be in order." We agree.

A union that has elected party status must be afforded the opportunity for meaningful participation in the settlement process, including the opportunity to participate in settlement negotiations. Asarco, Inc., 80 OSAHRC 104/F5, 8 BNA OSHC 2200, 1980 CCH OSHD ¶ 24,913 (No. 79-5557, 1980); ITT Thompson Industries, Inc., 78 OSAHRC 70/D10, 6 BNA OSHC 1944, 1978 CCH OSHD ¶ 22,944 (No. 77-4174, 1978). A union is also entitled under the Commission's rules to be served with a settlement proposal regardless of its party status; posting is insufficient. Commission Rule 100(c)(service of settlement on union); Commission Rule 7(a), 29 C.F.R. § 2200.7(a)(service of documents on parties); Babcock & Wilcox Co., 80 OSAHRC 95/A2, 8 BNA OSHC 2102, 2107, 1980 CCH OSHD ¶ 24,812, p. 30,567 (No. 78-446, 1980). We have also held that the union must be given notice that the served settlement proposal has been filed with the judge or Commission for approval and, thus, that its period for filing objections has begun. Id.; see Hearst Corp., 82 OSAHRC _____, 10 BNA OSHC _____, 1982 CCH OSHD ¶ _____ (No. 80-6051, 1982); American Cyanamid Co., 80 OSAHRC 40/C8, 8 BNA OSHC 1346, 1348, 1980 CCH OSHD ¶ 24,424, p. 29,791 (No. 77-3752, 1980), rev'd on another ground sub nom. Marshall v. Oil, Chemical & Atomic Workers Int'l Union, 647 F.2d 383 (3d Cir. 1981).

We are unable to say on this record that the union was afforded these rights. Certainly, there is no evidence that it was afforded any opportunity to participate in the settlement negotiations. The record also does not show that the service on the union gave notice that the settlement proposal had been executed by the other parties and that it was being filed with the judge for

approval. Under these circumstance, we shall remand this case to Judge Sparks for further proceedings in light of our recent decision in Mobil Oil Corp., 82 OSAHRC _____, 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982). 2/

Accordingly, the judge's decision is vacated; the case is remanded for further proceedings. 3/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: SEP 30 1982

---

2/ Under Mobil, a union is entitled to be heard on its objections to a settlement agreement and to have the merits of its objections considered by the judge when determining whether the agreement should be approved as consistent with the requirements of Commission Rules 100(a) and (b), 29 C.F.R. § 2200.100(a) and (b). We note particulary the union's objections in this case that the settlement proposal lacks an express provision for quarterly progress reports and interim protective measures while feasible engineering controls are investigated and implemented, that interim and permanent measures should be undertaken in accordance with two of its agreements with GM, that painting employees should continue to be given blood tests for lead every six months, and that GM should "institute a better program to maintain and care [for] . . . [r]espirators in accordance with [29 C.F.R. §] 1910.134(f)."

3/ Chairman Rowland dissents from this order of remand. For the reasons stated in his dissenting opinion in Mobil, the Chairman believes that consideration of the settlement agreement should be limited to any objection a union may have to the reasonableness of an abatement period agreed to by the Secretary and an employer. Inasmuch as the union's objections do not pertain to the reasonableness of the abatement period in the settlement, a remand for consideration of the adequacy of the settlement is inappropriate. Chairman Rowland would therefore affirm the judge's disposition on this ground.

## ORDER

The settlement agreement filed by the parties on November 30, 1978, and without objection from affected employees or their representative, is approved. Accordingly, the citation is amended as provided in the agreement, the proposed penalty of $240 is vacated, and the notice of contest withdrawn.

The abatement date is extended to end two years from the date this order becomes the final order of the Review Commission, unless extended by timely order of the Commission.

SO ORDERED.

Dated this 18th day of December, 1978.

DECISION

Before: CLEARY and COTTINE, Commissioners. */

BY THE COMMISSION:

This case is before the Commission on remand from the court of appeals. The First Circuit affirmed the Commission's ruling that Astra Pharmaceutical Products, Inc. ("Astra"), committed a serious violation of the standard at 29 C.F.R. § 1910.132(a), but the court remanded the case "for a more particularized finding by the Commission to support its imposition of the $800 penalty." Astra Pharmaceutical Products, Inc. v. OSHRC, 681 F.2d 69, 74 (1st Cir., 1982).

The issuance of a citation in this case was prompted by an accident that occurred at Astra's Worcester, Massachusetts, plant. A 200-gallon reactor vessel used in the production of chloroacetyl xylidine overflowed, spraying toxic chemicals. Paul Sund, the operator of the reactor vessel, was sprayed by the chemicals and seriously injured. The only items of personal protective equipment required to be worn by Astra employees who were working in the area of

---

*/ Chairman Rowland was not a member of the Commission when it issued its earlier decision concerning the merits of the alleged violation in this case. He, therefore, declines to participate now in determination of findings in support of a penalty predicated on that violation.

the reactor vessel were goggles, respirators, and gloves. Astra was found to have committed a serious violation of 29 C.F.R. § 1910.132(a) by failing to require such employees to use "full body protection," including boots, jackets, pants, and face shields constructed of materials impervious to the chemicals in the area.

An employer who commits a serious violation under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678, must be assessed a civil penalty of up to $1,000. 29 U.S.C. § 666(b). In assessing civil penalties, the Commission is to give due consideration to "the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations." 29 U.S.C. § 666(i).

It is clear that the chemicals involved in Astra's production of chloroacetyl xylidine presented hazards of high gravity. 1/ Chloroacetyl chloride is a strong irritant to the skin, eyes, nose, and throat. If the concentration inhaled is sufficiently high, chloroacetyl chloride can cause a constriction of the throat and consequential cessation of breathing. Benzene, which can be inhaled as well as absorbed through the skin, can cause irritation, dermatitis, disorientation, and, with prolonged exposure, aplastic anemia and leukemia. Xylidine, which also can enter the body through inhalation or absorption, limits the oxygen-bearing capacity of the blood and can cause death even when absorbed only through the skin. Sodium carbonate monohydrate presents a lesser hazard, skin irritation. Three of Astra's employees operated the reactor vessels used

---

1/ The process used by Astra to produce chloroacetyl xylidine is described in the prior decisions by the court of appeals and the Commission. Astra Pharmaceutical Prod., Inc. v. OSHRC, supra, affirming in part and remanding in part, 81 OSAHRC 79/D9, 9 BNA OSHC 2126, 1981 CCH OSHD ¶ 25,578 (No. 78-6247, 1981).

to produce chloroacetyl xylidine and were exposed to these chemicals. In addition, employees attempting to rescue an operator following an incident could be exposed to the same hazards.

The incident that Astra reported to OSHA and which led to the inspection in this case illustrates how serious that situation could be. A malfunction in a reactor vessel resulted in the employee on duty in the room, Sund, being covered from head to toe with toxic chemicals. That employee was seriously injured and hospitalized. Other employees who came to his aid were hospitalized for observation. Although the record does not reveal how seriously Sund was injured, see 681 F.2d at 73 n. 6, the potential for severe consequences is clear from the record as a whole. In conclusion, the gravity of the violation must be considered high.

As to the other elements relevant to penalty assessment, Astra did provide some protective equipment, and the compliance officer testified that Astra was very cooperative during his inspection. Thus, Astra demonstrated some good faith in this case. The Secretary introduced no evidence regarding Astra's size, or its history of previous violations, if any. Some penalty reduction is warranted in light of these factors.

In assessing penalties under the Act the Commission need not accord equal weight to the statutory factors discussed above. George J. Igel & Co., 6 BNA OSHC 1642, 1978 CCH OSHD ¶ 22,769 (No. 76-1087, 1978), citing Keyes Associates, 4 BNA OSHC 1794, 1976-77 CCH OSHD ¶ 21,180 (No. 13410, 1976). In our view, the high gravity of the violation, based on the probable severity of resulting injuries in the event of an incident, is the principal factor in determing the appropriate penalty in this case. See Ralston-Purina, 7 BNA OSHC 1302, 1979 CCH OSHD ¶ 23,507 (No. 76-2551, 1979). However, taking into account Respondent's partial abatement efforts, see Del-Cook Lumber, 6 BNA OSHC 1362, 1978 CCH OSHD ¶ 22,544 (No. 16093, 1978), and the lack of evidence regarding size and history, a

greater reduction from the statutory maximum of $1000 for a serious violation than was given by the Commission in its original penalty assessment is appropriate under the circumstances. In lieu of the $800 penalty previously assessed by the Commission, we assess a penalty of $500.

Accordingly, a penalty of $500 is assessed for Astra's serious violation of 29 C.F.R. § 1910.132(a).

SO ORDERED.

APPEARANCES:

Robert Yetman, Esq.,
Boston, Massachusetts
For Complainant

William LeDoux, Esq.,
Worcester, Massachusetts
For Respondent

DECISION

On November 7, 1978, an accidental overflow of the chemical ingredients used in the manufacture of xylocaine, an anesthetic drug, enveloped an employee of Astra Pharmaceutical Products (Astra) in its Worcester, Massachusetts, plant. Astra promptly reported this incident to the Occupational Safety and Health Administration (OSHA), the branch of the office of the Secretary of Labor responsible for the enforcement of the Occupational Safety and Health Act of 1970 (hereinafter call the Act), 29 U.S.C.A. §651 et seq., 84 Stat. 1590 et seq.

The next day, November 8, 1978, OSHA's Springfield, Massachusetts, Area Office dispatched an inspector, Michael F. Goyda, an industrial hygienist who testified at the hearing, to Worcester. When he arrived at about 11:00 a.m., he found that none of the equipment at the worksite was being operated so he never had an opportunity to observe the manufacturing process which is the subject of the citation that he recommended be issued.

The only other witness was Ronald S. Ratney, another industrial hygienist employed by the Secretary. His testimony was limited to the conclusions he reached based upon assumptions derived from discussions with Goyda and other similar sources. He has never been in Astra's plant at any time (Tr. 73, 94, 97).

The Respondent declined to offer any evidence.

The jurisdiction of Astra as an employer subject to the provision of the Act was conceded. Of the two citations issued after Goyda's inspection, Astra's notice of contest of Items 1, 2 and 4 of Citation No. 2 was withdrawn at trial so that they have become a final order by operation of law. Item 3 of Citation No. 2 having been withdrawn by the Secretary is vacated. Items 1, 2 and 3 of Citation No. 1 and the respective proposed penalties of $800 each were previously withdrawn by a pretrial motion by the Secretary. This leaves only Item 4 of Citation No. 1 in issue. It alleged:

> 29 CFR 1910.132(a): Protective equipment was not used where it was necessary by reason of hazards encountered in a manner capable of causing injury or impairment in the function of any part of the body:
>
> > ORGANIC SYNTHESIS BUILDING: RAW AREA--OPERATOR OF THE #1 REACTOR: THE FOLLOWING PERSONAL PROTECTIVE EQUIPMENT SHALL BE WORN:

A. FACE SHIELD.
B. GLOVES AND BOOTS IMPERVIOUS TO THE CHEMICALS BEING USED.
C. JACKET AND PANTS IMPERVIOUS TO THE CHEMICALS BEING USED.

Astra pleaded three affirmative defenses:

1. The event which led to the inspection was an isolated incident;

2. The standards are vague;

3. The Secretary failed to grant Astra its statutory right to "...be given an opportunity to accompany the Secretary or his authorized representative during the physical inspection of any workplace... for the purpose of aiding such inspection."

The evidence revealed that the Secretary did in fact (in violation of §8(e) of the Act) exclude the employer from private conferences with Astra employees during the inspection which is clearly in violation of the Act. (See Tr. 46, 63.) The provisions of §8(e) state that "...the employer... shall be given an opportunity to accompany the Secretary or his authorized representative during the physical inspection...are mandatory." See Chicago Bridge and Iron Co. v. Secretary of Labor, 535 F.2d 371, 375 (7th Cir. 1976).

The Secretary's assertion that there was no evidence that the Respondent was denied the right to participate in the inspection is grossly inaccurate. The Secretary's inspector deliberately denied the employer the right to be present while interviewing employee Dennis Liveris (Tr. 46, 60, 63). It logically follows that this denial of the Respondent's statutory rights would require vacation of the citation if it were not for the fact

that there is no proof of a violation in the record. For that reason none of the Respondent's affirmative defenses need be decided.

The only witnesses appearing for the Secretary were Goyda and Ronald F. Ratney. Goyda's knowledge of the facts was limited to what he was told the day after the incident. He did not, of his own knowledge, know what kind of protective clothing was usually worn by Astra's employees while operating the reactor. Ratney, although well qualified, intelligent and truthful, knew nothing of the facts. The Secretary failed to present any witness who could testify of his own knowledge of what, if any, protective equipment Astra's employees wore on the date of the incident or at any other time.

In the case at bar the Secretary was put on notice that there was a workplace subject to the Act where an employer might be allowing employees to handle chemicals without wearing protective clothing. The subsequent investigation performed by two highly qualified industrial hygienists was wasted because of the inadequacy of their training in law enforcement procedures and methods of investigation. As a result the benefit of their scientific knowledge was lost. They failed to find out what equipment, if any, was supplied to employees; when and under what circumstances they were told to use it; and, if told, whether this rule was enforced. This could have very easily been accomplished. The witnesses who could have supplied this information could have been found and presented, by subpoena if necessary. Instead all that was offered was the conclusions of Ratney based upon assumptions derived from speculation and hearsay he had gotten from Goyda restricted to one particular incident.

Goyda saw a respirator up on a desk but neglected to find out who it belonged to or what it was used for. The Secretary's only excuse was that an employee named Sund, who was the victim of the accident, was now incapable of appearing. Goyda could have gone back to the plant when it was in full operation and observe the procedures. He could have asked employees in the presence of the employer representative whether protective clothing was not only furnished but required to be used. If he suspected any reluctance of such employees to speak he would know (if adequately trained) that the Secretary has statutory authority under the provisions of §8(b) of the Act to require any material witness to submit to interrogation.

Goyda conceded that he had discussed the wearing of protective clothing with Astra's supervisor, Vince Mandella, and that he was told that protective equipment was worn whenever there was employee exposure (Tr. 56, 57). Whether, as may be inferred from other comments alleged to have been made by Mandella (who was not called as a witness), that employees may have removed the protective clothing during certain phases of the process, the admissions of Goyda that he was told that equipment was worn during exposure and his lack of personal knowledge of anything to the contrary leaves the Secretary without even a prima facie case of §132(a).

Hindsight should not be a criterion in the resolution of OSHA cases. Wisconsin Electric Power Company v. Secretary of Labor, 567 F.2d 735, 741 (7th Cir. 1977), but the isolated incident in which the employee Sund was injured on November 7, 1978, might have thrown some light upon the adequacy of employee protection if Goyda had sought more information about it. Other

employees who were present in the vicinity might have known what, if any, protective clothing Sund wore and what standard safety precautions were used normally. The failure of the Secretary to offer any of these employees as witnesses leaves the allegation that Astra did not require employees to use protective clothing when needed unsupported.

It is therefor hereby ordered that Item 4, Citation No. 1, alleging a violation of 29 CFR 1910.132(a) and the proposed penalty of $800 be vacated.

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>GENERAL ELECTRIC CO.,<br><br>Respondent. | OSHRC Docket No. 79-504 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Foster Furcolo is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). At issue before the judge was a citation that alleged a violation of section 5(a)(1) of the Act. 1/ The citation's description of the violation, as amended, was as follows:

> Employees were exposed to electrical hazards by failure to control employee movements in and around high voltage test equipment in the testing area ["Test Area"] with strict enforcement of recognized industry tagging and lockout procedures by:
>
> 1. The use of danger tags;
> 2. Proper instruction of lockout procedures;
> 3. Proper identification of incoming power disconnecting means, circuit breakers and control switches, so their purpose is evident; and
> 4. Proper lockout of power and control devices.

---

1/ Section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1), provides that "[e]ach employer . . . shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

In his decision, Judge Purcolo concluded that Respondent, General Electric Co. ("G.E."), violated section 5(a)(1) of the Act by exposing its employees to the hazard of electrical shock due to its failure to control employee movements, to use red (danger) tags, to have proper lockout procedures and devices, to identify electrical devices so their purpose was evident, or to have an adequate safety program. Respondent sought review of this holding, and review was directed. For the reasons set forth in this decision, we agree with Judge Purcolo's conclusion that the Secretary established that G.E. violated section 5(a)(1). However, we affirm the citation on a more limited basis than that set forth by the judge.

I

A

At the cited worksite, a plant in Pittsfield, Massachusetts, G.E. manufactured large, high-voltage power distribution transformers, devices designed to increase or decrease the voltage of electrical power going through them. Each transformer weighed up to 500 tons. As part of the manufacturing operation, during each of the three work shifts, Test Operators in G.E.'s Product Test Unit conducted electrical tests on power transformers after they had been assembled. These tests were designed to assure compliance with transformer manufacturing industry standards and customer specifications. Transformers were assembled and tested in Building 100, a very large, high, rectangular structure that was comprised of the Test Area at one end and the Assembly Area at the other. These two areas were separated by a chain-link fence. The Test Area was open in the center but, along the outside edge of at least one side, above the first (ground) floor, it had two additional levels.

The Test Area's first floor consisted primarily of six high voltage test berths and two impulse test berths. At issue in this proceeding are the conditions relating to the use of five of the high voltage test berths. Each of these

berths was surrounded by a chain-link fence 8 feet in height having one pedestrian gate at the first floor level. The chain-link fence separating the Test Area from the Assembly Area constituted part of the outer perimeter of the test berths. The other three sides of the fence around each berth were movable to accommodate transformers of differing sizes. At the second level of each berth, another gate separated a room where electrical controls were located from a catwalk that provided access to the tops of the transformers.

G.E.'s power system was "remote" in that the primary sources of power for the berths were sets of motor generators that were located in another building, Building 100A, and the controls for that power were in Building 100A. The set voltage supplied by the generators to the test berths ranged from 24,000 volts at Berth #5 to 230,000 volts each at Berths #1 & #2. Auxiliary power was also generated and controlled in Building 100A, as was the third source of power, which energized the wire resistance bridge. Each source of power had its own controls. In Building 100A were located the circuit breakers of the generators and about 35 selector board switches that routed the power from the generators to the various berths. The only G.E. employees who had keys to Building 100A were Granville Kemp, who was the Manager of the Product Test Unit, the five Test Foremen, the electrical maintenance crew, and two specialists. The Test Foremen were the supervisors of the Test Area; the first and second shifts each had two Test Foremen, while the third shift had one.

When a transformer was assembled and ready to be tested, it was moved by a huge crane from the Assembly Area to the Test Area, where it was placed in one of the berths. High voltage Test Operators then prepared the transformer for testing while the berth was deenergized. According to Test Operator James Kennedy, before Test Operators took any steps to energize a berth, they made sure that everyone was out of the berth. Kemp, the Manager of the Product Test

Unit, similarly testified that Test Operators were responsible for inspecting the berths before the berths were energized to assure that no unauthorized personnel were in them.

These three steps had to be taken before a berth could be energized: completion of the safety circuit, movement of controls on the second level, and movement of controls in Building 100A. To complete the safety circuit, the Test Operator (1) made sure the fence sections were interlocked, (2) connected leads that were located on the sides of the fence, (3) plugged in the cord at the gate, and (4) closed and locked the gate with a padlock. The berth could not be energized unless the safety circuit was completed. Moreover, if the safety circuit was broken during a test, e.g., by unlocking and opening the gate, the berth was automatically de-energized. Once the safety circuit was completed (but before the berth was energized), the pairs of lights over the pedestrian gates at the first and second levels and on the fence sections at the opposite end of the berth enclosure came on as yellow. The yellow lights alerted employees that the system was ready for the application of power.

Once the Test Operator completed the safety circuit, he or she climbed the stairs to the second level. Tests were conducted from that level by operating the controls located on a console there. The next steps in energizing the berth were for the Test Operator to move a switch on the console (the power change/power lock switch) to the power change position and to call for power from the Test Foreman. To route power from the generator to the designated berth, the Test Foreman moved the appropriate switches in Building 100A. A display board on the console at the second level of the Test Area notified the Test Operator when this power had been directed to the berth. When the Test Operator moved the power change/power lock switch back into the power lock position, he or she gained sole control over the power in the berth. The Test Operator then moved

some switches and breakers, and the various lights around the berth turned red, thereby signalling that the berth was energized. Only after all of these steps had been completed could the necessary tests be performed.

B

Assemblers spent most of their working time in the Assembly Area, where they completed the assembly of transformers before that equipment was sent into the Test Area berths. After the transformers had been moved to Test Area berths, either prior to or as a result of tests conducted on them, certain parts of the transformer often needed adjustment or repair. Presumably upon the request of the Test Operator or Test Foreman, the Assembly Foreman gave certain assemblers such work assignments as assembling cooler equipment and doing external and internal repairs. Assignments were given "probably on a daily basis" for about 15% of the assembler's working hours per week. The assemblers usually worked in pairs in the Test Area and brought with them from the Assembly Area the tools, such as wrenches and power tools, that they used for repairs.

After receiving their assignment, the assemblers entered the Test Area by way of the first-floor gate to the fence separating the Assembly Area from the Test Area. The assemblers were then supposed to climb the stairway to the second level where they could contact the Test Foreman to obtain a pass. Under the provisions of G.E.'s Product Test Unit safety manual, all employees who did not regularly work in the Test Area, a category that included assemblers, were required to get a pass from the Test Foreman before they entered a test berth. Upon receiving a request for a pass, the Test Foreman filled in the blanks on the pass form, usually with either one or both of the assemblers' names, and gave them one copy of the pass, keeping the other copy in the pass book. The pass contained blanks in which to write, among other information, the name(s) of

the employee(s) to whom it was issued, the reason for the issuance, and the date and time during which the pass was valid. 2/

When assemblers followed prescribed procedures in obtaining a pass, the Test Foreman also pointed out to them the berth in which they were to work. The Test Foreman's direction was necessary because the only information that the assemblers usually had on their assigned transformer was the purchase order number. The assemblers did not know the number of the berth that the transformer was in. Even if they did know the berth number, they usually did not know where to go because the berths were not marked by number. In addition, before the assemblers entered a berth, the Test Foreman moved and tagged a few switches located on the first and second floors. The Test Foreman then hooked or tied the cable at either the first- or second-level gate to the berth so that it would not be plugged in and, with a padlock, locked the gate in the open position so that no circuit could be completed and the berth could not be energized. After the assemblers had completed their work or their shift, they were expected to go back up to the second level to return their copy of the pass to the Test Foreman.

Kemp testified that a copy of G.E.'s Power Transformer Product Test Safety Manual had been available in each test berth since 1976. On the fence near the

---

2/ In addition, the pass stated that the undersigned Test Foreman certified that employees could proceed to work in safety because all power was off in the designated berth, all the safety gates were padlocked, and all incoming power breakers and switches were open and marked with red safety tags. Some of these precautions, however, were not in fact taken. Because G.E. had been using that same pass form since 1959, which was before Building 100 was constructed, some of the language on it applied only to the older facility, which had a different switching system than Building 100. According to Kemp, the pass, as it was used in Building 100, was intended to represent only the Test Foreman's permission to enter a designated berth and his assurance that the berth was safe, but Kemp admitted that the pass could mislead an employee to think that all of the specific instructions on it applied and were carried out. One assembler, Bernard Gregory, testified that he assumed that by signing the pass the Test Foreman certified that all of the precautions listed on the pass had been taken.

pedestrian gate at both the first and second levels of each berth was a sign reading: "NOTICE - NO ONE ALLOWED IN TEST AREA WITHOUT PERMISSION OF FOREMAN."

C

The testimony of several of G.E.'s assemblers established deficiencies in the nature and execution of G.E.'s pass procedure. When asked at the hearing if he got the permission of the Test Foreman before entering a test berth, Walter Milette responded, "Not necessarily the Test Foreman. We had a job assignment by the Tanking [Assembly Area] Foreman and this is an assignment by a Foreman that is supposed to know what he is doing." Milette further testified that he had not been issued a pass until about one week before the inspection. When asked if the Test Foreman stayed with him, Milette replied, "Periodically to check you out maybe, but he doesn't stay with you." Bernard Gregory testified that he had received passes at times from Kemp rather than from a Test Foreman. Gregory, as well as Stephen Volin, stated that there had been occasions when other employees who did not regularly work in the Test Area had entered through the open gate into the test berth in which the assemblers were already working without first obtaining a pass or having their names added to the assemblers' pass. Gregory stated his opinion that the Test Foreman probably would have assumed that all employees were out of the berth when a pass was returned even though some employees not specifically named on the pass could still be in the berth. Furthermore, Volin testified that, when he and his partner had requested entry, the Test Foreman had on occasions issued them a pass stating that it was for "Volin and company" and giving no other name. He added that a pass issued to "Volin and company" could cover as many as ten people. At the hearing, a pass was shown to Kemp that was completely filled out except that a question mark was in the space for the employees' names. The evidence described above establishes that G.E.'s pass system did not account for each assembler who entered a berth and that

passes were issued by at least one employee who, unlike the Test Foreman, played no part in energizing berths.

Unless the assemblers' job was one of very short duration, the Test Foreman usually did not stay with the assemblers while they worked in a berth, and the assemblers were not able to see the Test Foreman at all times while they were working in the berth. Moreover, when the assemblers performed internal repair work, they went inside the transformers where they were hidden from view. In response to a question as to how long he would stay inside a transformer, Milette testified that "I'd spend the whole night [shift] in there." The evidence also indicates that there was no physical obstruction to prevent an assembler from leaving an assigned berth and entering into any other berth if the gate to that berth were open. In addition, assemblers in one berth could have entered an adjacent berth without having to use the pedestrian gate, for they could have reached another berth by merely opening a section of the fence. One assembler testified that an employee could have crossed from one berth to the other without knowing it when some of the fence sections were not connected.

The record further shows that the assemblers as a group were generally unaware of the precautions that they themselves could take or that other employees were supposed to take and the safety rules that were established by G.E. in order to prevent their exposure to electrical shock. Specifically, the assemblers testified that, as of the time of the Secretary's inspection, they: (1) had not been formally told by management in writing or orally what procedures to follow in the Test Area (instead new employees learned what to do from more experienced workers); (2) had not received any information about the hazards facing assemblers in the Test Area in the Job Hazard Analysis Guide for their job; (3) had not seen G.E.'s Power Transformer Product Test Safety Manual; (4) did not know what some of the language on the pass referred to; (5) had not

received any information, orally or in writing, on the Test Area's circuitry and the location and function of the switches and breakers; and (6) did not know what the power, control, and fence voltages were in the various berths. Assemblers testified that they relied solely on the Test Foreman to assure that the berth was safe.

The testimony of the assembers indicates that they did not understand the hazards in the Test Area berths or the signals installed to alert them of the hazards. Both Gregory and Volin testified that, when they prepared to enter a berth after receiving a pass, they did not know for sure, but rather assumed, that power was out of the berth. Gregory also stated that, even if he had seen someone taking steps to "route the generators out of [the] berth," he would not have known what that person was doing. He indicated that, even if he had seen blinking lights or signals in the Test Area, he would not have known what they signified. Volin, who was a Safety Observer for the Assembly Division, testified that as far as the Test Area was concerned he had not reported any safety problems to anyone because he "wouldn't know what was right and what was wrong in there."

The Secretary's expert witnesses were critical of G.E.'s system of requiring assemblers to rely totally on the Test Foreman without being informed of hazards in the Test Area and means to prevent or avoid them. Bernard Battles, the compliance officer who inspected G.E.'s facility and was qualified as an expert, testified that in his experience supervising employees who worked in high voltage areas in both manufacturing and utility industries he could not recall a system requiring those employees to rely solely on their foreman's word that the area was deenergized before they began working there. When asked if G.E.'s procedures complied with the custom and practice of the utility industry, 3/ Wallace Edwards,

---

3/ We recognize that the utility industry differs from the power transformer manufacturing industry in many respects. However, the two industries are similar in that both involve work that at certain times exposes some employees to high voltage electricity.

who had worked as a foreman supervising employees in high voltage areas during his 35 years at Western Massachusetts Electric, testified:

> Absolutely not. I was appalled at what I heard. I cannot believe bringing a human being into a room with the possibility of such voltage where they don't know a darn thing about what is possible . . . .
>
> I think that General Electric Company could do much more in educating these people who go in there who are not electrical trades people.

The testimony of the Secretary's experts as well as that of the assemblers noted above establishes that assemblers were not given training commensurate with the danger of exposure to high voltage electricity that was part of their duties.

II

G.E. argues on review that the judge erred in determining that the Secretary proved by a preponderance of the evidence that G.E.'s employees were exposed to the hazard of electric shock in the test berths because it did not control employee movements, use red (danger) tags, have proper lockout procedures and devices, identify electrical devices so their purpose was evident, or have an adequate safety program. G.E. contends that it need not take those actions because its safety system, including the interlocked safety circuit and the precautions taken by the Test Foreman and the Test Operator, had already eliminated the hazard. Indeed, G.E. asserts that there is no evidence in the record that its employees were or could be exposed to electricity, and therefore electrical shock, while in the Test Area berths. It therefore concludes that the asserted omissions specified by the judge are irrelevant and immaterial because there was no hazard.

G.E. also takes exception to the judge's finding and conclusion that the recognition element of the alleged violation was established because G.E.'s

supervisory personnel knew of "the hazardous conditions that existed." It reasons that its supervisors could not have known of a nonexistent hazard. According to G.E., "[w]here the Secretary relies on the employer's knowledge of a recognized hazard, the Secretary has the burden of demonstrating . . . that the existing safety precautions were unacceptable in a relevant industry," a burden which he did not meet in this case.

G.E. also contends that the Secretary failed to show, as required to establish a section 5(a)(1) violation, that his suggested means of abatement were feasible and that they would eliminate or materially reduce the alleged hazard. G.E. argues that it established that "considerable operating problems and expense would be encountered if locking and tagging were forced into the system where they are not necessary." G.E. further asserts that the Secretary "failed to prove that there is a recognized industry procedure by which to control employee movements as charged in the Complaint." G.E. supports its principal position that there was no hazard by asserting that the Secretary's evidence on abatement measures consists of "arbitrary" opinions from persons inexperienced in the transformer manufacturing industry that certain measures should be taken "in order to prevent hazards which already have been eliminated by a safety circuit system." Finally, G.E. notes that, where necessary and sensible in its view, it did control employee movement, use danger tags, use lockout devices, identify switches, and otherwise follow an adequate safety program.

III

In order to establish a section 5(a)(1) violation, the Secretary must prove that: (1) the cited employer failed to render its workplace free of a hazard; (2) the hazard was recognized either by the cited employer or generally within the employer's industry; (3) the hazard was causing or was likely to cause death or serious physical harm; and (4) there was a feasible means by which the employer could have eliminated or materially reduced the hazard. E.g., Little Beaver Creek

Ranches, Inc., 82 OSAHRC __, 10 BNA OSHC 1806, 1982 CCH OSHD ¶ 26,125 (No. 77-2096, 1982). We conclude that the Secretary sustained his burden of proving each of these elements, and we therefore affirm the Secretary's citation.

A

The hazard in this case is shock or electrocution due to accidental contact by an assembler with an energized transformer undergoing production testing. As evidenced by its pass system, warning lights, and the fences around the berths, as well as the other precautions it has taken, G.E. itself recognized this hazard. Indeed, G.E. in effect conceded this when it made the following statement in its post-hearing brief, which it reiterated before the Commission on review:

> General Electric has recognized that unless properly handled and controlled serious injury or death can result from high voltage electricity. As a consequence it designed, built and operated its Transformer Test facilities with the safety of employees and others of paramount concern.

We reject G.E.'s contention that the Secretary's evidence is deficient because he failed to establish that there was a recognized industry procedure for controlling employee movement. The recognition element of a section 5(a)(1) violation refers to knowledge of a hazard and not recognition of the means of abatement. Kansas City Power & Light Co., 82 OSAHRC __, 10 BNA OSHC 1417, 1982 CCH OSHD ¶ 25,957 (No. 76-5255, 1982). We also reject G.E.'s arguments that (1) the Secretary had the burden of proving that its safety precautions were unacceptable in its industry and (2) the precautions it took rendered its workplace safer than the workplaces of others in the transformer manufacturing industry. Required abatement is determined by feasibility and an abatement order may prescribe practices of a higher standard than those an industry presently considers to be reasonable. Id. We conclude that the Secretary has met his burden of establishing the recognition element of the alleged violation.

B

G.E.'s principal argument on review is that it has satisfied its duty to "free" its workplace of the recognized hazard. G.E.'s use of the interlocking safety circuit and its system of warning lights substantially reduced the danger of an assembler entering a berth after it had been energized. Similarly, the procedures involving completion of the safety circuit, movement of controls in Building 100A, and movement of controls on the second level console reduced the possibility that a berth could be inadvertently energized.

Nevertheless, we do not agree with Respondent that its workplace was free of the hazard of shock or electrocution due to accidental contact by an assembler with an energized transformer undergoing production testing. Assemblers were exposed to this hazard if their presence inside a berth was not detected by the Test Operator or Test Foreman prior to energization of the berth. 4/ For example, an assembler working inside a transformer or behind some obstacle could have been overlooked by a Test Operator during the visual inspection of the berth in preparation for energizing it. In addition, a Test Operator could fail to detect an assembler inside a transformer if the Test Operator failed to conduct a thorough inspection. Such an oversight by the Test Operator would not have been remedied by the Test Foreman if the latter had no pass on file indicating that an assembler was still in the berth. Indeed, the record establishes that

---

4/ G.E.'s safety circuit would provide no protection to an assembler who entered a berth before the safety circuit was completed and who remained in the berth when it was energized. Similarly, G.E.'s multi-step procedure for energizing a berth, while effective in preventing inadvertent energization of the berth, would provide no protection to an assembler if a Test Operator intentionally energized the berth without knowing the assembler was in it. To eliminate the risk of an assembler being present inside a berth without the knowledge of the Test Operator and the Test Foreman at the time the berth is energized, it was necessary for Respondent to enforce an effective pass system and to train assemblers in proper Test Area procedures and safety precautions. This it did not do, as discussed <u>infra</u>.

it was not uncommon for an employee to be inside a berth without the knowledge of the Test Foreman, in part because of the Test Foreman's failure to issue a pass to each assembler who entered a berth and his failure to list the name of each assembler who entered a berth under a group pass. Furthermore, the evidence establishes that assemblers did not always get a pass for each berth they entered, assemblers sometimes went into the Test Area without getting any pass at all, and passes could have been returned to the Test Foreman before all of the assemblers were out of the berth. G.E.'s pass system therefore did not render the test berths free of the hazard.

Neither did other aspects of G.E.'s safety program, especially given the fact that the assemblers did not work with electricity or understand its properties. G.E. did not formally communicate the applicable contents of its Test Area safety manual to the assemblers and did not uniformly enforce those rules. Moreover, assemblers were not instructed as to the purpose and design of the safety precautions for the test berths or what steps they themselves could take to prevent exposure to the recognized hazard. 5/ As a result, assemblers were generally unaware of proper procedures in the Test Area and the precautions that could be taken to prevent injury. We therefore conclude that the absence of adequate safety training increased the possibility that an assembler would enter a berth before it was energized without the knowledge of the Test Foreman or the Test Operator, thereby increasing the risk that the assembler would be injured when the Test Operator subsequently energized the berth.

---

5/ In Little Beaver Creek Ranches, Inc., 82 OSAHRC ____, 10 BNA OSHC 1806, 1982 CCH OSHD ¶ 26,125 (No. 77-2096, 1982), the Commission recently reiterated its observation that safety rules are more likely to be followed if their rationale is explained and understood. This case is distinguishable from cases such as Jones & Laughlin Steel Corp., 82 OSAHRC 34/A2, 10 BNA OSHC 1778, 1982 CCH OSHD ¶ 26,128 (No. 76-2636, 1982), in which employees knowingly violated company safety rules on crane boarding solely for convenience.

The fact that no one has yet been electrocuted is not proof that G.E.'s safety program was adequate. In the first place, "[t]he keystone of the Act. . . is preventability." Brennan v. OSHRC (Underhill Construction Corporation), 513 F.2d 1032, 1039 (2d Cir. 1975). Inasmuch as "[o]ne purpose of the Act is to prevent the first accident," actual death or injury is not a prerequisite to establishing a violation. Lee Way Motor Freight Inc. v. Secretary of Labor, 511 F.2d 864, 870 (10th Cir. 1975); Brennan v. Butler Lime and Cement Co., 520 F.2d 1011 (7th Cir. 1975). Secondly, an employer may not shift responsibility for employee safety and health onto its employees by undue reliance on employee skill, intelligence, prudence, and the like. An employer's duty to do all it feasibly can to prevent or substantially reduce hazards includes the duty to anticipate and guard against that employee error and misconduct which falls short of the bizarre and uncontrollable. See General Dynamics Corp., Quincy Shipbuilding Div. v. OSHRC, 599 F.2d 453 (1st Cir. 1979); National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1974); see also Booneville Division of Ethan Allen, Inc., 78 OSAHRC 105/B4, 6 BNA OSHC 2169, 1979 CCH OSHD ¶ 23,219 (No. 76-2419, 1978). A pass system which is so lax that it ultimately depends on visual inspection by the supervisor for discovery of employees exposed to electrocution hazards does not adequately protect against human error.

C

It is undisputed that the recognized hazard of shock or electrocution from contact with an energized transformer is a hazard that is likely to cause serious physical harm or death. Therefore, the only remaining issue to be determined is whether the Secretary established the feasibility and likely utility of the abatement measures he proposed.

We conclude that inclusion of the name of each assembler who enters a berth on an individual or group pass, uniform enforcement and effective communication

of G.E.'s written rules regarding pass procedures, and improvement in safety training for assemblers were all proven to be feasible and useful measures that would eliminate or materially reduce the hazard in G.E.'s test berths. Accordingly, the Secretary has also established this final element of the alleged violation. 6/

IV

Accordingly, we affirm Judge Furcolo's conclusion that G.E. violated section 5(a)(1) of the Act. Having considered the factors set forth in section 12(j) of the Act, 29 U.S.C. § 666(i), and particularly the good faith shown by G.E. in taking extensive precautions in an attempt to eliminate the hazard, we assess a nominal penalty of $1.

IT IS SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: SEP 30 1982

---

6/ In addition to the methods that we have determined to be feasible, other abatement measures were suggested by the Secretary, i.e., using danger tags on switches, identifying switches so that their purpose is evident, locking switches, and permitting each assembler to use his or her own lock on the berth gate. While we do not rule on the feasibility of these measures, we note that G.E. must free its workplace of the hazard by any feasible means. Accordingly, G.E. must select and implement a combination of measures that will reduce the recognized hazard to the extent feasible. See Kelly Springfield Tire Co., OSHRC Docket No. 78-4555 (August 27, 1982).

ROWLAND, Chairman, dissenting:

I disagree with the majority's conclusion that G.E. failed to keep its workplace free from the recognized hazard of electrocution due to accidental contact by an assembler with an energized transformer during production testing. 1/ As the majority correctly observes, the safety circuit and warning lights installed by G.E. made it unlikely that an assembler would enter an energized berth, and these measures together with the sequence of steps required to energize a berth were sufficient to protect an employee against inadvertent reenergization of a berth which had been deenergized. The majority errs, however, in its further conclusion that assemblers were nevertheless exposed to the hazard because the measures required to reenergize a berth might be initiated while assemblers remained within the berth.

The majority's view is based on supposed deficiencies in G.E.'s system for insuring that all employees have left a berth before it is reenergized. As the majority indicates, G.E. required that test operators visually inspect each berth prior to initiating the reenergization procedure and also had a pass system by which the test foreman would be aware of the presence of assemblers in a berth. The majority claims, however, that a test operator might conduct his inspection of a berth in a careless manner or otherwise might overlook an employee. As to the pass procedures, the majority apparently concedes that power would not be restored

---

1/ I conclude that this formulation of the recognized hazard gives G.E. sufficient notice of its obligations consistent with my dissenting opinion in Kansas City Power & Light Co., 82 OSHRC 13/A2, 10 BNA OSHC 1417, 1982 CCH OSHD ¶ 25,957 (No. 76-5255, 1982). Accordingly, I need not now consider whether, as the majority states, a recognized hazard cannot be defined in terms of specific abatement methods. Similarly, in view of my disposition in this case, I express no opinion on whether under 29 U.S.C. § 654(a)(1) the Commission can require an employer to institute practices other than those presently understood as reasonable in the employer's industry.

to a barth until an outstanding pass had been returned to the test foreman but finds this assurance inadequate for the reasons that a separate pass was not issued to each individual employee and, in some instances, assemblers entered a barth for which no pass had been issued. The evidence does not support the majority's conclusions.

In describing the visual inspection of the test barth, Kemp, the test unit manager, stated that the test operator has the responsibility to "assure" himself that the test barth is clear prior to initiating reenergization. Test operator Kennedy, who testified as to the manner in which he discharges this responsibility, expressly stated that the inspection he performed was sufficient to insure that no one remained in the barth. In his words, "[i]f we have to walk around the tank or stand on top and walk around the tank, we do it and then we close the gates and then we apply power. First and foremost, we make sure that everyone is out of the area." There is absolutely no testimony to the contrary by any witness that a test operator's inspection of a barth prior to reenergization is not sufficiently thorough, nor is there any evidence that any employee had ever been undetected by a test operator during his inspection. Accordingly, the majority's conclusion that this visual inspection might be inadequate or performed improperly is nothing more than sheer speculation, unsupported by and indeed contrary to the evidence of record.

The same is true of the majority's determination that due to inadequacies in G.E.'s pass system the test foreman might not be aware of the presence of assemblers in a test barth. With the exception of instances in which assemblers are actually escorted and accompanied by either the test operator or test foreman, 2/ all of

---

2/ The testimony of Milette to which the majority refers does not establish that the test operator or foreman was unaware of his presence in the barth. In any event, as noted in the text of my opinion there is no evidence that a barth had ever been reenergized while an employee remained in it.

the employees testified either that they would obtain a pass before entering a specific berth or would enter without a pass only to assist other assemblers who had obtained a pass for that berth. 3/ Clearly, while the test foreman might not know the number and identity of all employees who are in a berth at any given time, he would be aware from the fact that a pass had been issued to a least some employees that work was being performed in the berth.

It is of course true as the majority states that the reenergization process can commence once all outstanding passes are returned to the test foreman. However, the record does not support the majority's supposition that passes might be returned before all employees have left the berth. The testimony of the employees indicates that passes are customarily issued to assemblers as opposed to other categories of employees who may have occasion to enter a berth to assist assemblers, and Gregory, who had 11 years experience working in the test building, stated that assemblers normally would be the last employees to leave the berth. 4/ Furthermore, there is no evidence of any instance in which the employees holding a pass had not been the last to leave a berth and, finally, no evidence that at any time a berth had been reenergized before all employees had left. Accordingly, the record fails to support the majority's conclusion that G.E.'s pass system exposed assemblers to the hazard of accidental contact with energized transformers during testing.

---

3/ The majority refers to a possibility that an assembler assigned to work in a particular berth could without the knowledge or authorization of a supervisor enter another berth in which he had no assigned duties. The record, however, fails to show that any employee had ever done so, nor is there any evidence from which one can conclude that the employer could reasonably be expected to anticipate such action by an employee. Indeed, at the majority itself indicates, the work is always assigned by the test foreman to a specific berth. Assembler Gregory stated that it is never necessary for non-test personnel to go into more than one berth at a given time and that he had never seen anyone go into a berth without proper authorization.

4/ Gregory mentioned crane operators and oilers as individuals who would on occasion assist him in his work.

Finally, the majority errs in its conclusion that apprising assemblers of the applicable contents of the test area safety manual and instructing them in the purpose and design of the safety precautions including the circuitry and switches would have materially reduced the exposure of assemblers to the hazard in question. On the contrary, the record including the testimony of the assemblers themselves amply demonstrates that they were sufficiently trained for the performance of their duties.

Other than its generalization that employees should be advised of the "rationale" underlying safety rules the majority does not specify what particular information should have been communicated to assemblers, nor does the majority explain how instructions in the "purpose and design" of the safety precautions would eliminate the hazard the majority finds in this case, that is, the possibility of an assembler entering or remaining in a berth without the knowledge of the test operator or test foreman. In any event, the record demonstrates that assemblers are fully aware of the importance of insuring that their presence in a test berth is known to the test operator or test foreman. Gregory, in describing the pass system, characterized it as affording security for an assembler to enter by providing assurance that the berth had been cleared. Similar testimony was given by Volin, who stated that based on the issuance of a pass he would assume that the foreman had taken responsibility for his safety while in the berth. Both Volin and Jordon further stated that the performance of their duties as assemblers did not require that they be familiar with the test area circuitry, and Gregory testifed that any explanation or demonstration of the deenergization procedures prescribed in the safety manual would not be meaningful to him. This employee testimony is consistent with the opinion expressed by Kemp. In testifying that assemblers did not need to be aware of the contents of the test area safety manual or of the location of breakers, disconnect switches and tags, Kemp described the philosophy of G.E.'s system:

> I think [assemblers] need to be provided an area to work in that is totally safe and they need to have that provided for them by someone who is knowlegeable and responsible. The system was desinged around that and we selected a Test Foreman, who had certain chores to do such as moving power from the test berth, which he normally does, and who is knowledgeable enough to know whether that has been accomplished and which gates to lock and which leads to intertwine and which switches to red tag. That is the reason it is written the way it is.

Although the majority notes the Secretary introduced testimony contrary to Kemp's opinion, that testimony is not persuasive. As the majority itself concedes, the Secretary's witness Edwards was limited in his experience to a substantially different industry from that at issue in this case. While witness Battles did have extensive experience with manufacturing facilities, his testimony demonstrates that he specialized in in-plant power distribution systems for plant operations. Kemp testified without rebuttal that G.E.'s test facility is distinguishable from such distribution systems because its function is to supply current on an intermittent as opposed to continuous basis. In view of Kemp's extensive experience and the fact that his testimony is consistent with that of the employees themselves, his opinion is reasonable and entitled to weight. Kelly Springfield Tire Co., OSHRC Docket No. 79-4555 (Aug. 27, 1982)(dissenting opinion); H.E. Wiese, Inc., 82 OSAHRC 18/A2, 10 BNA OSHC 1499, 1511, 1982 CCH OSHD ¶ 25,985 at 32,619 (No. 78-204, 1982) (dissenting opinion).

Based on this evidence, the majority clearly errs in concluding that G.E.'s employees were not sufficiently aware of the established safety procedures and in assuming that the employees could not be expected to comply with those procedures without additional instructions. 5/ See Little Beaver Creek Ranches, 82

---

5/ The majority claims that G.E. did not "uniformly enforce" the rules set forth in the test area safety manual but does not specify on what basis it reaches this conclusion. Kemp testified without rebuttal that G.E. maintains a program for disciplining employees who violate its safety rules, and the Secretary presented no evidence to show that this program was not adequately implemented.

(Continued)

OSAHRC 36/A2, 10 BNA OSHC 1806, 1982 CCH OSHD ¶ 26,125 (No. 77-2096, 1982) (dissenting opinion). As the Commission recently held in Jones & Laughlin Steel Steel Corp., 82 OSAHRC 34/A2, 10 BNA OSHC 1778, 1982 CCH OSHD ¶ 26,128 (No. 76-2636, 1982), additional distribution of safety rules and formal discussion of such rules is not necessary when employees indicate that they are familiar with the basic elements of the rule and show appreciation of the hazards to which the rules are directed.

I therefore would vacate the citation for failure of the Secretary to show that G.E.'s worksite was not free form the recognized hazard.

---

5/ (Continued)

In any event, as explained in the text of my opinion, the existence of G.E.'s pass system, together with its requirement that berths be inspected prior to reenergization, has been sufficient to protect assemblers from the hazard at issue. Accordingly, G.E. would not have been on notice of a need to take further steps to implement its safety rules. For this reason, I do not at this time consider whether an employer may properly be required to enforce workrules which have been communicated to employees. See Jones & Laughlin Steel Corp., 82 OSAHRC 34/A2, 10 BNA OSHC 1778, 1782-83 & n.9, 1982 CCH OSHD ¶ 26,128 at 32,887-88 & n.9 (No. 76-2636, 1982).

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>GENERAL ELECTRIC COMPANY,<br>Respondent | OSHRC DOCKET NO. 79-504 |

APPEARANCES:

Johanna Harris, Atty.,
Boston, Massachusetts
For Complainant

Edward L. Dobbins, Esq.,
Pittsfield, Massachusetts
For Respondent

DECISION

Furcolo, J.:

This case arose under 29 USC §651 et seq., of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection by the Occupational Safety and Health Administration (OSHA) of the Respondent's premises on or about December 11-18, 1978, Citation No. 1 was issued on or about January 5, 1979, charging that the Respondent violated §5(a)(1) of the Act by failing to furnish a place of employment free from recognized hazards. As amended, the Complaint alleged that employees were exposed to electrical

hazards by failure to control employee movements in and around high voltage test equipment in the testing area with strict enforcement of recognized industry tagging and lockout procedures by:

1. the use of danger tags;
2. proper instruction of lockout procedures;
3. proper identification of (electrical devices) so their purpose is evident; and
4. proper lockout of power and control devices (see Complaint and Tr. 239, 240).

On or about January 25, 1979, the Respondent filed Notice of Contest to the citation and the penalty proposed therefor.

The pertinent sections of the Act are appended to this decision.

PRELIMINARY

The worksite is a huge building housing very large transformers that are moved by giant cranes from the "Assembly Area" to the "Test Area". There are several "berths" for the generators which vary in size and have voltages running from 24,000 to 230,000. These berths are usually enclosed by movable chain link fences...Tr. 178, 183, 220-221, 254.

The Test Area is under the supervision of a Test Foreman; and no one is supposed to enter it without his knowledge and authorization. Test Area personnel who work in it daily enter routinely without any formal authorization but other employees--such as assemblers, crane operators, hitchers, and oilers--who do not enter daily but only occasionally, are supposed to obtain a "pass" signed by the Test Area foreman before entering and to return it

when leaving.

The hazard was severe injury or death caused by electrical shock.

## ISSUES

The Complainant contended that those employees who entered the Test Area only occasionally were exposed to the hazard of electric shock because the Respondent failed to:

1. follow adequate safety procedures in the use of the "pass" that authorized admission to the Test Area;
2. identify electrical equipment by "danger tags";
3. properly instruct employees in lockout procedures;
4. properly identify various power circuits, switches, and electrical equipment;
5. have an adequate safety training program; and
6. have lockable equipment wherever needed.

The Respondent contended that its procedures and safety program were adequate; and that no employee was exposed to any hazard if its safety system were followed.

## EVIDENCE

Evidence favorable to the Complainant's contentions tended to establish that the various berths differed in size from day to day and were not identified by other than the oral directions of the Test Area foreman or other employees...Tr. 17-19, 227-229; that employees did not know the location of power turn-offs, how generators were routed, and what metal objects were un-

grounded...Tr. 34, 41, 43, Ex. C-9 - 18; that there were no red (danger) tags or tagging of any kind on power turn-offs, disconnects, switches, or breakers ...Tr. 27-29, 42-48, 106-107, 117, 124-126, 146, 227-229, 247-253, Ex. C-9 - 13, 15; that management gave employees no oral or written instructions, or explanation of the hazards, or training in procedures to be followed to avoid the hazardous conditions...Tr. 26, 41-44, 51-53, 108, 131; that red tag and lockout procedures spelled out in the Respondent's Safety Manual were not followed...Tr. 50, 128, Ex. C-4; that employees enter the Test Area without a pass or authorization or knowledge of the foreman...Tr. 20, 25, 59, 58, 79, 121-124, 133, 144; that the Respondent's clearance procedure for employees entering the Test Area was never followed...Tr. 81-85, Ex. C-6; that all safety gates were not locked as they were supposed to be...Tr. 30; that there were several master keys for the padlocked gate...Tr. 173-177; that employees had been refused a key after a gate was locked...Tr. 34, 145; and that various switches were not lockable...Tr. 234-243, Ex. C-9, 17, 18.

Evidence favorable to the Respondent's contentions tended to establish that floor level and auxiliary power panel switches were red-tagged...Tr. 333, 337; that foremen were in the Test Area 85% of the time...Tr. 366; that each test berth had a safety manual available to employees...Tr. 323, 378, Ex. C-18, R-1; that reliance on the safety circuit and the Test Area foreman was the best safety measure...Tr. 324-329, 340; that switches that route power to various test berths were marked...Tr. 172, 173; that a system of yellow and red lights sufficiently alerted employees to the possible hazard of electricity...Tr. 96-99; and that there is no ANSI consensus standard con-

cerning tagout and lockout practices...Tr. 515.

On the question of industry practice, evidence that favored the Complainant's position tended to establish that it was not accepted industry practice to fail to identify switches in high voltage areas; or to have an undetermined number of keys available for locked gates and switches; or to fail to use warning tags; or to rely solely on the foreman's word that power is out...Tr. 307-312.

Evidence that favored the Respondent's position tended to establish that there are no standards or guidelines for the kind of electric system here; that there is no ANSI consensus standard for tagout and lockout practices; and that the Respondent's procedure is safer than that of any competitor... Tr. 391-393, 417, 418, 515.

DISCUSSION

Most of the testimony of the Complainant's witnesses was not contradicted in any way. In addition, supervisory personnel of the Respondent testified that there should have been a red tag on a power change/power lock switch... Tr. 345; the pass said power breakers were red tagged but some were not...Tr. 171; switches that routed the generators were not tagged...Tr. 171; the main power disconnect switch at the console was not red tagged...Tr. 165; some switches were identified in a way that even an electrical engineer could not understand without first consulting the Respondent...Tr. 172, 173; test foremen were out of the Test Area 15% of the time...Tr. 366; several keys for the padlock were held by maintenance men and supervisors...Tr. 173-177; the equipment shown in Exhibit C-9 - 12 was never red tagged...Tr. 373, 374; the Safety

Manual (Ex. R-1) was not communicated to the assemblers...Tr. 339, 340, 381, 382; and explaining the electrical system to employees would have increased safety...Tr. 398.

That testimony from the Respondent's chief witnesses tended to corroborate the Complainant's contentions.

There was also no evidence introduced by the Respondent to contradict the Compliance Officer's testimony that the National Electrical Code clearly indicates that every switch, feeder, and branch circuit device should be clearly marked so its purpose is evident...Tr. 233.

"RECOGNIZED HAZARD"

As far as industry practice is concerned: in my opinion, three or four companies do not constitute an "industry" as that term is used in occupational safety and health cases. Moreover, to be a "recognized hazard" (under §5(a)(1) of the Act) a condition must be acknowledged as such by a substantial portion of commercial enterprises engaged in the same kind of business or operation within a particular industry. Here, the Respondent apparently has only two or three competitors and there is no uniformity of procedures or practices...Tr. 349, 417, 418, 515.

I find that the evidence does not establish a "hazard recognized in the industry".

However, the evidence does establish that a reasonable person familiar with the business of manufacturing and electrical testing of power transformers would have recognized the hazard of exposing employees to the possibility of

electric shock through failure to follow clearance procedures, to control employee movements, to use danger tags, to identify electrical devices so their purpose is evident, to have lockable devices and proper instructions in lockout procedures, and to have an adequate safety program for personnel not familiar with the electrical system. The Respondent's supervisory personnel had knowledge of the hazardous conditions that existed. Its foremen, Unit Manager, Manager of Plant Engineering, and the Manager of Industrial Hygiene and Safety in the Large Transformer Business Division (among other supervisory personnel) all were familiar with the area, the conditions, and the practices of personnel. The Respondent knew, or should have known, of the hazardous conditions. That is sufficient to establish a "recognized hazard". [See Brennan v. OSHRC and Vy Lactos, 494 F(2) 460 and Marshall v. L.E. Myers, 589 F (2) 270.]

Assuming that the Respondent's practices or procedures are safer than those followed by its competitors (Tr. 417): while that is commendable, it does not estaglish that they are proper or safe. The same applies to the Respondent's excellent record concerning injuries.

FEASIBILITY

The hazardous conditions could be easily and economically corrected by establishing and enforcing clearance procedures, identifying and tagging electrical devices, and following an adequate safety program. In fact, most of those steps have already been taken by the Respondent.

## FINDINGS OF FACT

Having heard the testimony, observed the witnesses, and examined the exhibits, the following Findings of Fact are made:

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines;
2. Many of the Respondent's employees were exposed to the hazard of sustaining serious or fatal harm due to electric shock because of the Respondent's failure to control employee movements, or to use danger tags, or to have proper lockout procedures, or to identify electrical devices so their purpose is evident, or to have proper lockout devices, or to have an adequate safety program; and
3. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazards.

## CONCLUSIONS OF LAW

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and that the Occupational Safety and Health Review Commission has jurisdiction over the subject matter and the parties;
2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have known, of the alleged violations;
3. The Complainant has sustained the burden of proving the Respondent violated §5(a)(1) of the Act (§654).

ORDER

The whole record having been considered, and due consideration having been given to 29 U.S.C. §666(j), Citation No. 1 is affirmed and a penalty of $100 is assessed therefor.

So ordered.

| SECRETARY OF LABOR, Complainant, | : | |
| v. | : | OSHRC Docket No. 79-2698 |
| DAVIS-McKEE, INC., Respondent. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor ("the Secretary") issued to Respondent, Davis-McKee, Inc. ("Davis-McKee"), a citation alleging that Davis-McKee willfully violated the trenching standard at 29 C.F.R. § 1926.652(c). 1/ Administrative Law Judge Cecil L. Cutler, Jr., vacated the citation, and the Secretary petitioned for review of the judge's decision. Commissioner Cottine granted the Secretary's petition under section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). We reverse Judge Cutler and affirm the

---

1/ The standard provides:

§ 1926.652 Specific trenching requirements.

* * *

(c) Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each ½-foot horizontal. When the outside diameter of a pipe is greater than 6 feet, a bench of 4-foot minimum shall be provided at the toe of the sloped portion.

citation as a serious violation of the cited standard. We assess a penalty of $500. 2/

I.

Davis-McKee, a subcontractor, was repairing a sewer line in connection with the erection of a convention center in Columbus, Ohio, when compliance officer Charles Perry arrived at the worksite. Perry observed two of Davis-McKee's employees operating an earth compactor in a trench. The trench was quite long and turned in two locations. In the southeast portion of the trench, where Perry observed the employees operating the earth compactor, he measured the trench to be 17 feet, 6 inches deep, and, at the top, 15 feet, 11 inches wide. Perry estimated the width at the bottom as 7 feet.

Perry testified that the type of soil in the trench was hard and compact and that the trench was not shored or otherwise supported or adequately sloped. In his opinion, employees were subject to being "crushed or killed" if a cave-in occurred.

Robert Wilson, Davis-McKee's operations manager, testified that the trench was sloped in accordance with the standard except for an area on one side where a concrete caisson was embedded. The caisson was part of the foundation of the convention center. According to Wilson, the caisson was 10 feet in diameter and was embedded 30 feet into the ground. Wilson testified that the length of wall at the bottom of the trench that was "taken up" by the caisson was 6 to 8 feet.

---

2/ In a letter filed in lieu of a brief after review was directed, the Secretary asked that the violation be affirmed as serious and refrained from pursuing his earlier contention that the violation was willful. Therefore, we do not address whether the violation was willful.

A sketch of the trench was prepared by an employee of the general contractor after Perry left the worksite on the first day of the inspection. 3/ Using the measurements shown on this sketch, an engineer prepared for Davis-McKee cross-section diagrams of various segments of the trench, drawn to scale, which Davis-McKee introduced into evidence. One cross-section diagram, labeled exhibit R-4, depicts a section of the trench next to the caisson and shows the trench wall across from the caisson as having a constant slope of 2.3 vertical feet to 1 foot horizontal. 4/ The trench wall located next to the caisson is depicted as having a steep slope, approximately 7½ vertical feet to 1 foot horizontal. Exhibit R-4 also shows the caisson as tangent to or abutting the trench wall only at the top of the trench. The exhibit thus shows a triangular wedge of soil, which widens as the trench depth increases, between the caisson and the trench wall. Wilson testified that exhibit R-4 accurately depicted the trench in the area of the caisson.

Davis-McKee also introduced into evidence two photographs of the trench taken on the day of the inspection. These photographs show rebars protruding from the ground above the caisson. The trench walls are shown in these photographs to consist almost entirely of soil; only a minimal amount of concrete is shown as constituting part of the trench wall next to the caisson.

II.

In his decision, Judge Cutler concluded that the trench wall opposite the caisson in the area where the two employees were working was sloped to a greater degree than required by 29 C.F.R. § 1926.652(c). While the judge found that the

---

3/ This sketch was introduced into evidence by the Secretary. Compliance officer Perry, however, stated that some of the measurements shown on the sketch did not agree with the measurements he made.

4/ The slope is labeled as 2.3 to 1 on the diagram. Approximately the same slope also can be derived by measuring the slope depicted in the exhibit.

trench wall near the caisson could not be sloped to any significant extent, he concluded that the caisson, in effect, provided shoring or bracing sufficient to prevent collapse or cave-in of that side of the trench. The judge therefore concluded that Davis-McKee had not violated section 1926.652(c).

III.

The Secretary takes exception to the judge's conclusions that a concrete caisson formed part of the facing of the trench and that the caisson provided, in effect, sufficient shoring or bracing to prevent the trench's collapse or cave-in. The Secretary also asserts that the judge erred in finding that the side of the trench opposite the caisson was adequately sloped. The Secretary requests that the citation be affirmed as a serious violation.

The Secretary argues that the caisson provided insufficient protection on that side of the trench because the caisson did not directly abut the trench wall but instead was separated from it by a volume of soil. The Secretary also contends that, because the caisson was circular, soil was present between the caisson and the trench wall on either side of the caisson's center. The Secretary asserts that the trench should have been shored according to the cited standard since the amount of soil capable of collapsing on exposed employees was not negligible. 5/

Davis-McKee contends that the judge's findings are supported by the record and the Commission should not reweigh the evidence. Davis-McKee asserts that the caisson "minimized any substantial risk of wall collapse" in the area where the employees were working because the caisson had "more inherent strength than

---

5/ The Secretary also argues that the judge erroneously concluded that the caisson was 30 feet in length. Since we affirm the citation on other grounds, we need not address this contention.

a normal earth wall." Davis-McKee also argues that the cited standard is not applicable to the side of the trench by the caisson, because that side of the trench consists of the concrete caisson rather than soil.

IV.

The Commission's review authority includes the authority to decide all issues it could have decided as the initial decision-maker. The Commission is not limited to the role of a reviewing court that must sustain factual findings of administrative agencies if such findings are supported by substantial evidence. Little Beaver Creek Ranches, Inc., 82 OSAHRC ____, 10 BNA OSHC 1806, 1982 CCH OSHD ¶ 26,125 (No. 77-2096, 1982). Accordingly, Davis-McKee's argument that we may not disturb the judge's disposition in this case is without merit.

Section 1926.652(c) requires that the walls of trenches more than 8 feet long and 5 feet deep dug in hard or compact soil must be shored or otherwise supported. If shoring or other support is not used, the portions of the walls more than five feet from the bottom of the trench must be sloped. Such sloping must not be steeper than a 1-foot rise to each one-half-foot horizontal. If, however, the trench in question is excavated entirely in solid rock, shale, or cemented sand or gravel, section 1926.652 does not require shoring or sloping. Crawford Construction Co., Inc., 82 OSAHRC 16/A2, 10 BNA OSHC 1522, 1982 CCH OSHD ¶ 25,984 (No. 79-928, 1982); CCI Inc., 80 OSAHRC 127/D4, 9 BNA OSHC 1169, 1981 CCH OSHD ¶ 25,091 (No. 76-1228, 1980), aff'd, 10 BNA OSHC 1718 (10th Cir., June 9, 1982).

It is undisputed that the trench on the side of the wall near the caisson was not sloped in accordance with section 1926.652(c). Exhibit R-4 shows that the caisson was tangent to the trench wall only at the top of the trench and that below this point the trench wall was separated from the caisson by a volume of

soil which increased as the trench depth increased. 6/ Davis-McKee put exhibit R-4 into evidence, and its operations manager testified that it accurately depicted the trench. The configuration of the trench as depicted in exhibit R-4 is not inconsistent with the photographs of the trench or the Secretary's evidence concerning the trench. Therefore, we find that exhibit R-4 accurately depicted the configuration of the trench. From this exhibit, it is apparent that the caisson did not serve as the trench wall and that the amount of soil between the caisson and the trench wall was not insignificant. 7/ See W.N. Couch Construction Co., 76 OSAHRC 44/A2, 4 BNA OSHC 1054, 1056 n.5, 1975-76 CCH OSHD ¶ 20,574 at p. 24,592 n.5 (No. 7370, 1976). Further, because the caisson was not located at the edge of the trench, it was not positioned so as to support the trench wall. Thus, the caisson did not constitute shoring nor did it otherwise support the trench wall. As evidence also establishes that employees were working in the area of the trench close to the caisson, we find that Davis-McKee failed to comply with the requirements of section 1926.652(c) with respect to the part of the trench wall that was located near the caisson.

We also conclude that the trench wall opposite the caisson was not sufficiently sloped. Exhibit R-4 constitutes an admission by Davis-McKee that the trench wall opposite the caisson had a slope of 2.3 feet vertical for each foot horizontal. This slope is steeper than that permitted by the cited standard, which requires that, except for the bottom five feet, the trench be sloped no

---

6/ Using the dimensions and slopes of the trench walls shown in the exhibit, our calculations indicate that this triangular wedge of soil had a base at the bottom of the trench of approximately 2 feet.

7/ In addition to exhibit R-4, the photographs of the trench indicate that the amount of soil between the caisson and the trench wall was not insignificant. Further, the photographs indicate that the caisson did not reach to ground level, but rather there was a quantity of soil above the caisson adjacent to the trench wall.

greater than 2 feet vertical for each foot horizontal. Because the trench wall opposite the caisson was not sufficiently sloped above the five-foot mark, it did not comply with section 1926.652(c).

We also find that the violation was serious within the meaning of section 17(k) of the Act, 29 U.S.C. § 666(j). 8/ To prove a serious violation, it need not be likely that an incident occur. It is only necessary to prove that if an incident occurs, the probable result will be either serious injury or death. See, e.g., Andy Anderson, 78 OSAHRC 34/A2, 6 BNA OSHC 1595 (No. 76-4082, 1978). The unrebutted testimony of compliance officer Perry, which we accept, was that the likely result of collapse of the trench would be death or serious bodily harm. We further find that there is ample evidence to establish that Davis-McKee knew or, with the exercise of reasonable diligence, could have known of the presence of the violation.

In assessing a penalty, we consider the factors set forth in section 17(j) of the Act, 29 U.S.C. § 666(i), and determine that a penalty of $500 is appropri-

---

8/ Section 17(k) provides:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

The Secretary did not allege a serious violation in the citation or in any pleadings filed prior to the hearing. See note 2, supra. However, at the hearing, compliance officer Perry was questioned about the characterization of the violation, to which he responded that he recommended that the citation be characterized as serious. Davis-McKee did not object to this testimony, nor did it take exception to the Secretary's argument on review that a serious violation be found. Under these circumstances, we find that there was trial by consent of the parties of the seriousness of the violation. See Dye Constr. Co., 78 OSAHRC 51/A2, 6 BNA OSHC 1685, 1978 CCH OSHD ¶ 22,810 (No. 4172, 1978).

ate. In assessing this amount, we find that, while the gravity of the violation is high, Davis-McKee made an attempt to comply with the standard by sloping the trench wall opposite the caisson.

Accordingly, we reverse the judge and find a serious violation of 29 C.F.R. § 1926.652(c). We assess a penalty of $500.

SO ORDERED.

Ray H. Darling, Jr.

RAY H. DARLING
Executive Secretary

DATE: SEP 30 1982

ROWLAND, Chairman, dissenting:

The evidence in this case is insufficient to establish that either side of Davis-McKee's trench violated 29 C.F.R. § 1926.652(c). Therefore, I dissent from the majority's affirmance of the citation. Rather, I agree with the judge that the citation should be vacated.

As the majority notes, section 1926.652(c) does not require an employer to slope the walls of a trench if the trench is excavated in solid rock, shale, or cemented sand or gravel, or if the trench is shored or otherwise supported. In this case, a concrete caisson was embedded next to one of the trench walls. Administrative Law Judge Cecil R. Cutler, Jr., found that this caisson provided, in effect, shoring or bracing sufficient to prevent collapse or cave-in of that side of the trench in the area where employees were working.

Nevertheless, the majority concludes that there was a wedge of soil between the trench wall and the caisson which was "not insignificant," and, therefore, the trench wall should have been shored. However, the Secretary did not put into evidence any measurements or calculations to show that the volume of this soil was significant, nor did the Secretary show that this soil could cause a collapse or cave-in of the trench. Although the Secretary introduced evidence as to the depth and width of the trench, he failed to introduce evidence showing the trench wall's slope or measurements from which the slope of the wall could be derived. Evidence of the slope of the trench wall would be necessary for determining the quantity of soil between the wall and the caisson. The majority relies solely upon Davis-McKee's evidence--in particular exhibit R-4 and two photographs of the trench--to conclude that the trench did not comply with the cited standard.

Exhibit R-4, a cross-section diagram of a portion of the trench, was drawn by Thomas Ashton, an engineer who had never seen the trench.[9/] Ashton drew exhibit R-4

---

9/ Davis-McKee's operations manager, Wilson, testified that exhibit R-4 properly (Continued)

based on exhibit C-1, a drawing of the trench made by the general contractor at the site. At the hearing, the compliance officer marked with an "X" the location on exhibit C-1 where he had seen two Davis-McKee employees working in the trench. Exhibit R-4 shows a cross-section of the trench at a location different from that where the compliance officer testified that he observed the employees working. Therefore, the majority's reliance on exhibit R-4 is inappropriate. Further, in exhibit R-4 Ashton apparently set the slopes of both trench walls arbitrarily, because exhibit C-1, the drawing on which exhibit R-4 is based, does not give the slope of either trench wall or provide measurements from which the slopes can be calculated.[10/] Therefore, the quantity of soil between the caisson and trench cannot be reliably determined on the basis of exhibit R-4. Because exhibit R-4 does not depict the trench at the location where the employees were working, and because the evidence does not establish that exhibit R-4 reliably represents the slope of the trench wall by the caisson, I am unable to conclude that there was a significant amount of soil between the caisson and the trench wall.

I do not find the photographs of the trench any more persuasive in showing that Davis-McKee failed to comply with section 1926.652(c). The photographs are too small and indistinct to reveal with any precision the

---

9/ (continued)

depicted the trench on the day of the inspection. However, Wilson was not questioned at that point in the hearing about the slopes of the trench walls. Therefore, it cannot be inferred from Wilson's general approval of the exhibit that the slopes depicted in the exhibit were correct.

10/ Ashton testified: "On examination of the photographs, it was apparent that the slope of the soil in the trench near the caissons was much steeper than a one-half to one slope. So we adjusted our cross-section to reflect the fact that this slope was more nearly vertical." Ashton's testimony, however, does not indicate why the particular slopes of approximately 7.5 to 1 on the side of the caisson and of 2.3 to 1 on the opposite side were depicted in the exhibit.

slope of the trench wall or the amount of soil that was present between the caisson and the adjacent trench wall. Further, the record does not indicate whether the photographs depict the portions of the trench where Davis-McKee's employees were working. Therefore, the photographs provide no support for finding that there was a significant amount of soil between the caisson and the trench wall.

I also disagree with the majority's conclusion that the trench wall on the side of the trench opposite the caisson was not sufficiently sloped. The Secretary introduced no evidence of the slope of the trench wall opposite the caisson or any measurements from which this slope can be calculated. Therefore, the majority relies solely upon exhibit R-4 in finding that the trench wall opposite the caisson was too steeply sloped. As noted above, exhibit R-4 does not depict the portion of the trench where the compliance officer testified that Davis-McKee's employees were working, and the slopes of the two trench walls shown in exhibit R-4 apparently were selected arbitrarily. Because exhibit R-4 does not provide reliable evidence of the slope of the trench wall opposite the caisson, and because there is no other evidence of the slope of this wall, I find no basis for concluding that the trench wall opposite the caisson did not comply with section 1926.652(c). Therefore, I would affirm the judge's vacation of the citation.

APPEARANCES:

William S. Kloepfer, Esquire, Associate Regional Solicitor, U. S. Department of Labor, Cleveland, Ohio, by Saundra Robinson, Esquire, for the complainant.

Robert Wilcox, Esquire, and Lee Durban, Esquire, Wilcox and Schlosser Company, L.P.A., Columbus, Ohio, for the respondent.

## DECISION AND ORDER

Cutler, Judge:

Following an inspection of its work site in Columbus, Ohio, on May 8, 1979, respondent, Davis-McKee, Inc., was issued two citations pursuant to section 9(a) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq., hereinafter the "Act").

Citation Number 1 alleges a violation of 29 C.F.R. § 1926.28(a)[1/] as follows:

---

1/ This section, 29 C.F.R. § 1926.28(a), reads:

"The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees."

"Appropriate personal protective equipment was not worn by employee(s) in all operations where there was exposure to hazardous conditions:

a) The trench, on the southwest side of the new Convention Center at 350 North High Street, there was no foot protection with metatarsals being worn by the two employees while using the earth compactor machines."[2]

A penalty of $800 is proposed for this alleged serious violation.

Under Citation Number 2 respondent is charged with a willful violation of 29 C.F.R. § 1926.652(c)[3] as follows:

"The side(s) of the trench(es) in hard or compact soil, including embankment(s), were not shored or otherwise supported when the trench was more than 5 feet in depth and more than 8 feet in length:

a) The trench being refilled and compacted on the southwest side of the new Convention Center at 350 North High Street, in Columbus, Ohio."

A penalty of $8,100 is proposed.

A hearing was held in this matter on October 18, 1979, in Columbus, Ohio. No affected employee or authorized employee representative elected to participate as a party.

There is no issue as to jurisdiction in that respondent admits it is an employer engaged in a business affecting interstate commerce within the meaning of the Act.

---

2/ Variously called tamping machines, compacting machines or "jumping jacks".

3/ This section, 29 C.F.R. § 1926.652(c), states:

"Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2-foot horizontal. When the outside diameter of a pipe is greater than 6 feet, a bench of 4-foot minimum shall be provided at the toe of the sloped portion."

I

Davis-McKee is an Ohio corporation engaged in the excavation business. On May 8, 1979, it was a subcontractor for Turner Construction Company repairing a sewer line in connection with the erection of a convention center in Columbus, Ohio.

On that date, Charles Perry, a compliance officer for the Secretary, visited the site pursuant to an imminent danger complaint. Upon his arrival, he saw two workers operating an earth compactor in an excavation and observed the job conditions and equipment. The excavation was not shored or supported. He took several photographs and attempted to take measurements but, as to the latter, he could not do so unassisted because of the configuration of the excavation. He went to his office and returned with another compliance officer, a Mr. Koontz, to assist him (Tr. 11-13).

According to Mr. Perry, the excavation "ran, at the west side of the trench it ran from the north to the south and then made a turn went southeast and made another turn and went northeast." The employees were "in the southeast section of the trench" (Tr. 14). As for its dimensions, "it measured 14 feet 9 inches across at the northeast end sloped down at this end to a depth of 9 feet. The northwest section ofthe trench was 52 feet 4 inches long. The north side of the trench running from east to west was 40 feet 4 inches long. The excavation was 30 feet wide at the west end between the two manholes and was 16 feet 2 inches deep on both the north and south side" (Tr. 15).

At the point where the two employees were using tamping machines, the trench was 17 feet, 6 inches, deep and 15 feet, 11 inches, wide. He did not measure the width at the bottom but estimated it as being 7 feet wide (Tr. 16).

The following morning, Mr. Robert Compton, another compliance officer, who has had considerable experience in the inspection of construction sites, made other measurements of the excavations using a 50-foot steel tape and an optical tape measure. These measurements were given to Mr. Perry (Tr. 103). According to Mr. Perry, these measurements were essentially the same as he had made on the previous day (Tr. 23).

Complainant presented into evidence a diagram of the excavation (Ex. C-1) which was made for Richard Patton, project superintendent for Turner Construction Company at the time. This was given to Mr. Perry by Mr. Patton at the closing conference that morning (Tr. 24). During the closing conference, Mr. Perry also received from Mr. Patton a copy of a warning which had been issued respondent on May 8 concerning the safety of the trench (Ex. C-2).

In further testimony, Mr. Perry stated that both he and Mr. Compton agreed that the type of soil in the trench was hard compact. The trench was not shored or otherwise supported and it was not sloped according to the standard charged (Tr. 29-30). In his opinion, employees in the trench was subject to "being buried if not crushed or killed if a cave-in happened" (Tr. 31).

To establish that the alleged trenching violation was repeated, complainant introduced into evidence, over respondent's objection, Exhibit C-3, copies of citations issued respondent on August 17, 1978, for a serious violation of 29 C.F.R. § 1926.652(e) and a repeated violation of 29 C.F.R. § 1926.652(c). Both citations were affirmed with reduced penalties pursuant to a settlement agreement (Ex. C-4).

With reference to the citation involving lack of foot protection, Mr. Perry testified that if the compacting machine bounced on a worker's foot, it could cause serious injury to the foot (Tr. 38).

Gary R. Rutledge testified he was the architect's representative for the project (Tr. 79). During an inspection trip on April 27, he observed that a trench box which previously been used was not in place. At that time and on May 1, he brought this to the attention of the general contractor's superintendent. On May 8, he observed the trench to be still in an unsafe condition and so reported this to OSHA (Tr. 80-90).

Called by the Secretary as a witness, Virgil Metcalf testified he was employed by Davis-McKee on the project in question and, at the time of the inspection, he was using the tamping machine. A trench box had been used prior to the inspection when pipe was being laid, but it was removed once all the pipe was installed. He believed that the ditch then was safe since it was "already filled up." At that time the depth of the trench was roughly 15 feet (Tr. 91-95).

Upon cross-examination, he testified he was not wearing steel-toed shoes at the time and had never worn them in his 14 years of using the tamping machines or "jumping jacks." He has never heard of anyone getting hurt using them and he considered his work safe without using steel-toed shoes (Tr. 96-97).

Thomas Ashton, called by respondent as a witness, testified he is a licensed civil engineer and employed by Davis-McKee since July 1979. Working with the figures shown in Exhibit C-1 in prepared cross-section segments of the excavation drawn to scale, he used an overlay (Ex. R-7) of a trench with a lay back of one half to one (Ex. R-1 — R-7). The substance of his testimony was that, while not symmetrical in all cases, the sides of the trench complied with the provisions of the regulations (Tr. 116-128).

Robert Wilson, respondent's operations manager, testified to and identified, using photographs (Exs. R-8 — R-9), a caisson 10 feet wide and in excess of 30 feet long which was part of the facing of the trench (Ex. C-1, R-8, R-9; Tr. 132).

According to Mr. Wilson, Davis-McKee started work repairing damaged sewers at the work site about three weeks prior to the day of the inspection. The pipe had been laid and backfilling operations had been started. The trench box was removed because it was contemplated that a heavy roller would be used instead of the compacting machine. After four to six feet of dirt had been placed over the pipe, a soil compaction test showed the soil did not have the proper density. The soil was removed and replaced with alternate layers of dirt and granule. This required the use of the compactor rather than the roller (Tr. 133-138).

Mr. Wilson testified that compacted earth would be less likely to slide in a trench than undisturbed soil. In his opinion, except for the place where the caisson was situated, the angle of repose of the trench was proper under OSHA standards. Concerning exhibit C-2, the warning from Turner, he stated this referred to a two-foot undercut which developed a knot on the slope and it was immediately corrected (Tr. 139-144).

With reference to the footwear worn by the man using the compacting machine, he stated that he was wearing regular laced boots. The company has had very few foot injuries with this type of boot. In his experience of 20 years, he has never heard of any injury in his company or any other company caused by a jumping jack. He has also never heard of anyone in the industry using steel-toed shoes while using the jumping jack (Tr. 136).

Stanley D. Pomeroy is a licensed engineer and surveyor. According to this witness for respondent, an optical tape measure has a margin of error of one foot in either direction. Therefore, there could be an error of at least a foot in a distance of 15 feet. He further stated that, unless the walls were symmetrical, they could not be plotted properly (Tr. 172-173).

II

Under Citation Number 1, respondent is charged with violating 29 C.F.R. § 1926.28(a) by failing to provide foot protection for two employees. There is no dispute that the employees operating an earth compactor were not wearing steel-toed shoes.

Respondent argues that it is not an industry standard to require foot protection and that a reasonably prudent person familiar with the industry would not recognize the need for same.

With respect to industry standards on personal protective equipment under 1926.28(a), the Commission has clearly pointed out that, while industry custom and practice are useful points of reference, they are not controlling. Whether a hazard exists is determined by whether a reasonable person familiar with the factual circumstances surrounding the allegedly hazardous condition, including those applicable to a particular industry, would recognize a hazard warranting the use of personal protective equipment, S & H Riggers and Erectors, Inc, 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1979 CCH OSHD ¶ 23,480, appeal filed, No. 79-2538 (5th Cir. June 9, 1979).

In the instant case, Mr. Perry testified he has made only seven or eight inspections of construction sites (Tr. 8) and in none of these has he seen workers operating tamping machines (Tr. 38). Upon cross-examination, he admitted he made no attempt to determine what the standard in the industry was as far as requiring the use of protective footwear while using a compacting machine (Tr. 54). Further, he has never heard of an injury by an employee operating a compacting machine (Tr. 55).

Mr. Metcalf, an operator of a compacting machine, testified that in his 14 years of experience, he has never heard of anyone getting an injury while operating

the machine (Tr. 96-97). With 20 years' experience in the industry, Mr. Wilson has never heard of the practice of using steel-toed shoes by tamping machine operators and cannot recall any injuries to employees in his or any other company from use of the machine (Tr. 130-136).

It is abundantly clear that there is no evidence presented to establish that it is industry custom or practice that employees operating tamping machines wear steel-toes shoes. In fact, the opposite has been shown.

Further, following the guidelines set forth in S & H Riggers, supra, no showing has been made that a reasonable person familiar with the factual circumstances surrounding the allegedly hazardous condition, including any facts unique to this particular industry, would recognize a hazard warranting the use of steel-toed shoes.

Mr. Perry admittedly has had no experience with tamping machine operations. He perceived a hazard through the very nature of the up and down movement of the machine which could cause it to bounce on a worker's foot (Tr. 38). Nevertheless, he has never heard of any injury from this cause and Mr. Metcalf and Mr. Wilson, both with extensive experience in the industry, attested to the same. Mr. Metcalf, who operates the machine for a living, considered the work safe without use of safety shoes (Tr. 97).

The Secretary has not shown that a hazardous condition existed which required the use of steel-toed shoes. The absence of injuries supports a conclusion that a reasonable person familiar with the operation here involved would not recognize the existence of such a hazard.[4/] Accordingly, I do not find respondent in violation of the cited standard.

---

4/ General Electric Co., __ OSHARC __, Docket No. 15037, dec. January 31, 1980.

III

Citation Number 2 alleges a willful trench violation. Much of the conflict in the evidence relates to the measurements taken of the excavation and whether it was in fact a trench. A trench is an excavation but an excavation is not always a trench.[5/] It would appear from the evidence that part of the 52-foot excavation was a trench.

However, only one part of the excavation is here involved and that is where the two employees were working when observed by the compliance officer. There is no evidence to suggest that employees were working at other locations since compaction was the only work being performed at the time.

According to Mr. Perry, at this location the trench was measured as being 17 feet, 6 inches, deep and 15 feet, 11 inches, wide. He estimated the bottom width as being 7 feet. While Mr. Perry's figures were substantially verified by those taken the following day by Mr. Compton, there could have been some discrepancy in view of the margin of error associated with the optical tape measure. Further, the lack of summetry of the walls, according to Mr. Pomeroy, could lead to improper plotting.

Assuming, however, the validity of Mr. Perry's measurements, the width at the top would have to be 19 feet to conform to the standards—a fact conceded by Mr. Pomeroy.

Exhibit C-1, the diagram of the excavation introduced by the Government, points to a different conclusion. This exhibit was prepared by a civil engineer after

---

5/ Section .653(n) defines a trench as a "narrow excavation made below the surface of the ground. In general, the depth is greater than the width, but the width of a trench is not greater than 15 feet."

the inspection and before the closing conference and thus was contemporaneous with the measurements taken by the compliance officers.

Using the figures depicted in Exhibit C-1, Exhibit R-4 shows that the side of the excavation opposite the caisson was sloped at a greater angle than the required one-foot rise for each one-half foot horizontal distance. The walls obviously could not be sloped to any significant extent on the side which contained the caisson, but this structure itself provided, in effect, shoring or bracing sufficient to prevent collapse or cave-in of the excavation.

Under the circumstances, I cannot conclude that respondent was in violation of the provisions of 29 C.F.R. § 1926.652(c).

In view of the findings herein reached, it is unnecessary to rule on the various motions made by respondent before and during the hearing.

IV

I reach the following findings of fact and conclusions of law:

FINDINGS OF FACT

1. Davis-McKee is an Ohio corporation which on the date in question was a subcontractor repairing sewer lines in connection with the construction of a convention center in Columbus, Ohio.

2. On May 8, 1979, Charles Perry, a compliance officer, inspected the work site. Two of respondent's employees were operating tamping machines in an excavation. Neither was wearing steel-toed or safety shoes.

3. There is no evidence presented of a history of foot injuries to respondent's employees caused from the operation of the tamping machine. There was no showing that a hazardous condition existed from which a reasonable person familiar with the factual circumstances could conclude that safety shoes were warranted.

4. At the location of the two employees, Mr. Perry measured the trench as 17 feet, 6 inches, deep and 15 feet, 11 inches, wide. He visually estimated the width at the bottom as being 7 feet. His figures were essentially the same as those taken the following day by another compliance officer using a steel tape and an optical tape measure. The soil was hard compact in nature.

5. The optical tape measure has a margin of error of at least one foot in 15 feet.

6. In the area of the excavation where the two employees were working there was a concrete caisson 10 feet wide and in excess of 30 feet long which was part of the facing of the trench.

7. This caisson provided support on one wall of the trench and the opposite wall was sloped to a greater degree than required under the one-foot rise to one-half foot horizontal formula in the regulations.

8. There is no evidence to establish that respondent's employees at the time and place in question were exposed to the hazard of a cave-in or slide.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting interstate commerce and this Commission has jurisdiction over the subject matter and parties to this action.

2. Respondent was not in violation of section 5(a)(2) of the Act by failing to comply with the provisions of 29 C.F.R. § 1926.28(a) or 29 C.F.R. § 1926.652(c).

Based upon the foregoing findings of fact and conclusions of law, Citation Number 1 and Citation Number 2 are vacated.

SO ORDERED.

Dated this 20th day of March, 1980.

ORDER

Before: ROWLAND, Chairman; CLEARY, Commissioner.*/

BY THE COMMISSION:

An order of Administrative Law Judge William E. Brennan approving a settlement agreement between the Secretary of Labor and Amoco Oil Company is before the Commission for review. The judge held that the Oil, Chemical and Atomic Workers International Union and its Local 7-1 were not entitled to an evidentiary hearing on certain objections it raised to the agreement. The principal issue on review is whether an employee party can object to the plan of abatement contained in a settlement agreement between the Secretary of Labor and a cited employer.

---

*/ Commissioner Cottine has disqualified himself from participating in the disposition of this case on consideration of the Respondent's motion seeking his disqualification and the memoranda filed in response by the Secretary and the Authorized Employee Representative.

The two participating members are divided on the disposition of this case. Chairman Rowland would affirm the judge's ruling on the ground that the Commission lacks authority to consider employee objections which are not related to the abatement period. Mobil Oil Corp., Docket No. 77-4386 (Aug. 6, 1982) (dissenting opinion). Chairman Rowland notes that the Secretary and Amoco modified the agreement to accommodate the Union's objections to the time permitted for abatement, thus eliminating from any possible controversy the one point on which he would permit an employee party to object to a settlement agreement. Commissioner Cleary would vacate the judge's order and hold that the Commission has jurisdiction to consider the Union's substantive objections to the settlement agreement. For the reasons stated in his concurring opinion in Mobil Oil Corp., supra, Commissioner Cleary would hold that under section 10(c) of the Act affected employees who have elected party status must be afforded the opportunity to review and raise objections to settlements proposed by the other parties, including objections to matters other than the abatement period specified in a settlement proposal.

In view of the divided vote on the merits of the case, Chairman Rowland and Commissioner Cleary agree to dispose of the case by vacating the direction for review. Baldwin Industries, Inc., 82 OSAHRC , 10 BNA OSHC 1572, 1982 CCH OSHD ¶ 25,980 (No. 78-741), appeal filed, No. 82-7178 (11th Cir. May 28, 1982).

Accordingly, the direction for review is vacated and the judge's order is the Commission's final disposition of this case. SO ORDERED.

ORDER GRANTING STIPULATED SETTLEMENT

Brennan, William E.; A.L.J.

This matter comes on for determination pursuant to 29 U.S.C. 659(c) and 661(i) and Commission Rule 100, 29 C.F.R. 2200.100, upon a Settlement Agreement received by the Commission on April 20, 1981 (R.p. J-124)[1], as amended on June 11, 1981 (R.p. J-131), involving one Serious Citation (one numbered Item) and Notification of Proposed Penalty issued to Respondent by Complainant on October 24, 1979 as amended on November 16, 1979.

This Agreement, executed by counsel for Complainant and Respondent herein, complies with the requirements established by the Commission for

[1] References are to the numbered pages in the Commission's Official Docket File of this case, No. 79-6487.

hospitable consideration. (See, Secretary of Labor v. Duncan Brothers Mechanical Contractors, 1 OSAHRC 386, February 22, 1972 and Commission Rule 100, supra.)

This Agreement is not signed by the Union party. Rather, by letter dated April 22, 1981, the International Union filed its objections to numerous provisions of the Agreement reached by Complainant and Respondent. In its objections the Union moved for an evidentiary hearing thereon (R.p. J-125).

The original Settlement Agreement, among other matters, provided for the alleged violative condition to be abated "... 90 days following the date this agreement becomes a final order of the Occupational Safety and Health Review Commission... ."

(Para. 1(b), p. 2, R.p. J-124)

The Union's first numbered objection to this original Settlement Agreement alleged the 90-day abatement period "... is too long and unreasonable."

(Para. 1, p. 1, R.p. J-125)

In response to an Order to Show Cause issued on April 24, 1981, (R.p. J-126), Complainant and Respondent executed and filed an Amendment to the original Settlement Agreement dated June 11, 1981 (R.p. J-131). In this Amended Agreement, the abatement date agreed to was changed to "... immediately following the date this agreement becomes a final order of the Occupational Safety and Health Review Commission... ."

(Para 1(b), p.2, R.p. J-131).

In a letter dated June 16, 1981, the non-signing Union party advised that; "We wish to make it absolutely clear that our Objections to the Settlement Agreement that were filed with you on April 22, 1981 [R.p. J-125],

with the sole exception of objection no. 1, still stand." The Union also, in this letter, "... reiterate[d] the necessity for a hearing in this case."

(R.p. J-132, bracketed material supplied).

In response to a briefing Order dated June 24, 1981, (R.p. J-133), both Complainant and Respondent timely filed their briefs on the question of whether an evidentiary hearing on the Union's objections to the Amended Settlement Agreement, was either necessary or jurisdictionally proper (R.pp. J-135 and J-136).

Thereafter, on July 10, 1981, (R.p. J-137) the Union timely filed its response to both the Complainant's and Respondent's briefs.

The U.S. Courts of Appeals have uniformly held that under the provisions of Section 10(c) of the Occupational Safety and Health Act, 29 U.S.C. 659(c), a union party may object, exclusively, to the reasonableness of an abatement period proposed by Complainant in a Settlement Agreement. See U.A.W. - Local 588 v. OSHRC, 557 F.2d 607 (7th Cir., 1977); Marshall v. Sun Petroleum Products Co., et al., 622 F.2d 1176 (3rd Cir., 1980); Marshall and IMC Chemical Group, Inc. v. OSHRC, 635 F.2d 544 (6th Cir., 1980); Marshall v. Oil, Chemical and Atomic Workers International, et al., ___ F.2d ___ (3rd Cir., 1981), 9 OSHC-BNA 1584.

Here, the Union's original objection to the reasonableness of the original 90-day abatement period, was specifically withdrawn when the Amended Settlement Agreement provided for an "immediate" abatement period. All other objections filed by the Union party here, go to matters other than the reasonableness of the "immediate" abatement period agreed to by Complainant and Respondent in the Amended Settlement Agreement.

It is therefore clear under the uniform precedents cited supra, that the Commission does not have jurisdiction to receive evidence in support of the Union's objections at the requested evidentiary hearing.

Consequently the request of this Union party for an evidentiary hearing must be denied and its objections to the Amended Settlement Agreement must likewise be denied.

The Union's complaint that it did not have an opportunity to participate in the settlement negotiations nor to review and comment on the Settlement Agreement prior to the time that this Agreement was signed by Complainant and Respondent is not borne out by this record.

This case has been the subject of protracted pretrial procedures, the Citation having issued to Respondent late in 1979. The International Union representative has been actively involved in these procedures. This representative evidently was not involved in the relatively recent negotiations leading to the original and Amended Settlement Agreement. However, even if he had participated in these negotiations, his role would have been limited to objecting to the reasonableness of the time period agreed upon for abatement. See the IMC case, supra. Since the filing of the original Settlement Agreement, the Union party has had ample opportunity (three months) and indeed did file its objections to this settlement.

Thus this record establishes that the Union has been afforded ample opportunity to exercise its rights in this settlement case, rights which are limited under the binding, precedential case cited supra.

Now, therefore, pursuant to Commission Rule 100, and the case law cited supra, it is ORDERED:

1. That the Settlement Agreement received by the Commission on April 20, 1981 (R.p. J-124) as amended on June 11, 1981 (R.p. J-131) is hereby expressly incorporated by reference into and made a part of this Order and, based upon the representations set forth therein is APPROVED.

2. That Complainant's Motion to Amend the Amended Serious Citation and Notification of Proposed Penalty, as set forth in this Amended Agreement, is hereby GRANTED.

3. That the Respondent's Motion to Withdraw its Notice of Contest, as set forth therein is hereby GRANTED.

4. That the Citation herein and the penalty proposed thereon, as amended, are hereby AFFIRMED.

5. A penalty in the total amount of $405 is hereby ASSESSED.

6. That the Union party's Motion for an evidentiary hearing and its objections to the Amended Settlement Agreement (R.p. J-125) are DENIED.

| v. | : | OSHRC DOCKET NO. 82-458 |
| THE BALTIMORE & OHIO RAILROAD COMPANY, | : | |
| Respondent, | : | |
| BROTHERHOOD OF RAILWAY CARMEN OF THE U.S. AND CANADA, | : | |
| Authorized Employee Representative | : | |

ORDER

A September 3, 1982 letter from the Authorized Employee Representative (hereafter "union") to the Commission was construed as a petition for discretionary review and granted by Commissioner Cleary on September 17, 1982.

The record indicates that on May 11, 1982, the union sent the Secretary a notice of intent to participate in the hearing in this case. This letter is properly construed as an election of party status. See IMC Chemical Group, Inc., 78 OSAMRC 95/C14, 6 BNA OSHC 2075, 2076 n. 4, 1978 CCH OSHD ¶23,149, p. 27,989 n. 4 (No. 76-4761, 1978) rev'd on other grounds, 635 F.2d 544 (6th Cir. 1980).

On August 9, 1982, having been advised by the Secretary that "all matters in dispute had been amicably resolved," Administrative Law Judge Burroughs cancelled the hearing which was scheduled for the next day, August 10. On August 18, the citation was affirmed based on Respondent's motion to withdraw its notice of

contest. By letter dated August 18, the Secretary for the first time notified Judge Burroughs that the union had elected party status in this case. The Judge then notified the Authorized Employee Representative that prior to granting the Respondent's motion to withdraw he had been unaware of the union's election of party status. He advised the union that any objection to the disposition of the case should be filed with the Commission.

The union asserts in its September 3 letter that "all matters [have not] been resolved" in this case and expresses its continuing desire to take part in a hearing.

We cannot conclude on the present record that the union has had an adequate opportunity to participate as a party in these proceedings. Accordingly, we set aside the Judge's order of August 18, 1982, and remand the case to him to consider the union's apparent objections*/ and for any further proceedings that may be appropriate.

IT IS SO ORDERED.

---

*/ For the reasons stated in his dissenting opinion in Mobil Oil Co., 10 OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982), Chairman Rowland believes that the only cognizable objections the union may raise relate to the period for abatement contained in the citation.

| SECRETARY OF LABOR, | ) | |
| Complainant, | ) | |
| v. | ) | OSHRC Docket No. 82-458 |
| THE BALTIMORE AND OHIO RAILROAD COMPANY, | ) | |
| Respondent. | ) | |

**ORDER GRANTING RESPONDENT'S**
**MOTION TO WITHDRAW NOTICE OF CONTEST**

Respondent, by letter dated April 15, 1982, from its counsel, contested an "other" citation issued to it on April 1, 1982. The citation alleged a violation of 29 C.F.R. § 1910.22(b). No penalty was proposed for the alleged violation.

On August 16, 1982, a motion to withdraw notice of contest was received from respondent. The motion having been read and considered, it is

ORDERED: 1. That the motion is granted; and

2. That the "other" citation issued to respondent on April 1, 1982, is affirmed.

Dated this 18th day of August, 1982.

James D. Burroughs

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION
John W. McCormack Post Office and Courthouse, Room 420
Boston, Massachusetts 02109

NOTICE OF DECISION

Secretary of Labor v. The Hale Manufacturing Company
OSHRC Docket No. 80-3013

1. Enclosed is a copy of my decision. It will be filed with the Commission on September 2, 1982, and will become the final order of the Commission on October 4, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is October 4, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

David J. Knight
DAVID J. KNIGHT
JUDGE, OSHRC

Date: August 13, 1982

|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>THE HALE MANUFACTURING COMPANY,<br>Respondent | OSHRC DOCKET NO. 80-3013<br><br>DECISION AND ORDER |

APPEARANCES:

For the complainant,
Albert H. Ross, Regional Solicitor
U. S. Department of Labor
Boston, Massachusetts
By: John Casler, Esq.

For the respondent,
William J. LeDoux, Esq.
Bowditch and Dewey
Worcester, Massachusetts

On February 15, 1980, Brian Hamilton, an employee of The Hale Manufacturing Company (respondent) at its Yantic, Connecticut, plant, fell or jumped from a beam into a mass of yarn being blended in the respondent's Truslow Yellow Blending bin where the yarns were being blended for color (Transcript, hereafter Tr., 5, 7, 18, 60 and Exhibit C-6). Two fellow employees, at the floor level dug into about eight feet of the yarn to Hamilton who was unconscious with a little piece of yarn in his mouth (Tr. 19, 33, 39). He later died (Tr. 43). This is the first fatility in a blending bin in 26 years (Tr. 125-126). Nowhere does the record reveal the cause of death.

The blending bin is 16 feet square and 32 high (two stories) made of corrugated metal. The Truslow blender is at the top and this spews out the blended yarn into the bin. The bin's capacity is 25,000 pounds and on February 15, there was between 16,000 and 18,000 pounds there (Tr. 64). It is removed to be baled from a door at the bottom (Tr. 9, 11, 59-60) shown in Exhibit C-4. Near the top of the bin a door leads to a catwalk below which a structual beam runs across the bin perpendicular to the catwalk (Tr. 8) shown on Exhibit C-2 (Tr. 9, 10). To the inspecting officer, this beam looked like two attached one by eights (Tr. 61). It is about 13 and a half feet from the floor (Tr. 102). As the blender blows the yarn into the bin, it gets caught behind the beam and an employee will go out along the catwalk, step off onto the beam and jump on the yarn until it falls (Tr. 13-14). As the stock or yarn is removed from the bottom, a tunnel is formed and a man will be sent out on the beam to knock the stock down to fill this tunnel (Tr. 52-53).

During the lunch break of the second shift on February 15, 1980, the foreman, John LaFemina, instructed Hamilton to go up to the beam and help employees Dimmock and DuHaine knock the stock down (Tr. 44). He had, on a number of occassions instructed men not to fool around, to act sensibly (Tr. 44-45, 47). To accomplish the "knock down", a man hangs from the beam until it is at shoulder level and jumps on the stock until it falls (Tr. 14, 30-31, 46). It requires about five minutes (Tr. 16) and must be done at least once or twice a day (Tr. 135).

Dimmock heard Hamilton tell DuHaine that he was going to slide down the stock, that is, "he was going to ride down with it" (Tr. 29). And he was gone (Tr. 18). Although Dimmock did not see how Hamilton left the beam, one minute he was there, the next not (Tr. 18). Dimmock and DuHaine ran down the

two flights and dug him out of the yarn unconscious. That took about five minutes. (Tr. 19) The stock had been up to and higher than the beam and sloped 15 feet down or so (Tr. 35, 37).

Dimmock who was 18 years old at the time of the hearing had been with respondent only about two weeks when this event occurred (Tr. 6, 25). Concerning the knock-down procedure, he had received no safety instructions or safety belt and, by the time of Hamilton's descent, he had done it four or five times (Tr. 15). He had never slid down the stock and DuHaine was fired soon after for drinking on the job (Tr. 24-25, 54-55, 131).

The beam is one inch thick at its top and then slopes outwardly, a triangular configuration (Tr. 24, 87). A man walks out on it then climbs off holding onto the beam and knocks down the stock (Tr. 70, 98), and then climbs back (Tr. 40).

Compliance Officer Hatcher, as a result of his inspection on February 18, 1980, testified that employees knocking down the stock should be tied off with a safety belt and six foot lanyard attached to the catwalk's rail or the beam. This is common knowledge since a man could be buried in the stock (Tr. 64, 66, 74, 49) and suffer from the lack of oxygen (Tr. 80), although the material is not densely compacted, there is enough so a man could not breathe (Tr. 81). So attached, if he fell, he would not be buried for he could be pulled out in seconds (Tr. 77). The Officer did not know whether the man would be hanging in open air, if he fell, or would be within the stock; it depends on how much of the stock is there (Tr. 66-68). Other safety measures that could be taken would be handholds such as a rope or U-bolts attached to the beam for a man to hold on to while stepping down the stock. The beam itself is not sufficient (Tr. 61, 88-89).

This was the Officer's first inspection of a bin of this kind (Tr. 70) in his eight years with the Occupational Safety and Health Administration (OSHA) a section within the U.S. Department of Labor (Tr. 57). He was aware that respondent operates five facilities in Connecticut (Tr. 71), that some of these had been inspected in the past -- not this one at Yantic — that citations have been issued but he did not examine them (Tr. 72, 90-91).

On May 2, 1980, OSHA issued a citation[1/] alleging that respondent seriously[2/] violated the safety standard at 29 CFR §1910.132(a) which requires:

> Protective equipment...shall be provided, used, and maintained... wherever it is necessary by reason of hazards of processes...capable of causing injury or impairment...

in that no protective equipment (safety belts), devices, work processes, procedures and/or equivalent means were provided to assure the safety of employees knocking down the stock. This condition was to be abated immediately and a civil penalty of $720 was proposed. On May 21, 1980, respondent contested the citation.[3/]

---

1/ Under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§651, et seq., citations are issued after inspection, §658(a), and may be contested within a 15 working-day period, §659(a).

2/ A serious violation exists where there is a substantial probability that death or serious physical harm could result from the condition. 29 U.S.C. §666(j).

3/ See footnote 1, above, Upon contest, a respondent is afforded an opporunity for a hearing, 29 U.S.C. §659(c). At this hearing, both parties were represented, no employee came forward to claim party status, §659(c) (Tr. 4), and post-hearing briefs were filed by December 22, 1980.

Respondent presented three witnesses, its Director of Yarn Manufacturing (Porter) and two plant managers (Adams and Wuorio) whose total experience with respondent is 66 years and 94 years generally in this business covering all aspects (Tr. 93, 95, 119-120, 137). All testified that the stock creates no breathing hazard even when buried in it. The snythetic fibers blended are much lighter than woolen. (Tr. 101, 102, Porter, 129, Adams). Mr. Wuorio, who has 35 years experience, used to go to sleep in the bins capable of holding four times as much with the stock blowing in. The only danger was from a man removing the stock with a pitchfork. He might stab a sleeping employee. (Tr. 139-140) But the material is very fluffy and a man simply walks around in it till it is compact (Tr. 94-95 Porter, 130 Adams).

From the blender, the stock flows down at an angle of 25 or 30 degrees from the back of the beam at approximately the middle of the room to the door at the lower level, similar to a ramp (Tr. 104, 106-107 Porter). As a man hangs onto the beam, his feet would be a maximum of six feet from the floor. There is always stock on that floor (Tr. 116, 118 Porter), two or three feet of it (Tr. 129 Adams). The beams across the four separate bins are unique at the Yantic mill; none of the bins at the other mills have these (Tr. 124, 135 Adams), and at the Ballowville plant, where Wuorio is the plant manager, the employees working in pairs walk off the catwalk, stepping down the stock until it is packed with no problems (Tr. 142-143).

A support rod for the blender extends across the beam two or three feet over it for a man to hang on to which shows on photo Exhibit R-3 (Tr. 97-98, 112 Porter).

All three of these witnesses agree that there is no hazard in the bins and two stated that safety belts are not necessary and would cause more bodily harm

than a six foot fall into the soft stock (Tr. 103 Porter, 128-129 Adams). In his 33 years in this field, Mr. Porter knows of no one injured or killed in a bin (Tr. 107); Mr. Adams knows of no injuries such as a broken limb (Tr. 126-127); and in Mr. Wuorio's 35 years of activity there have been no fatalities or injuries (Tr. 140-141).

There is a safety committee at the Yantic plant supervised by the corporate safety department and safety rules are enforced by, first, a verbal warning, then written and, on the third infraction, the employee will be discharged. The company has a safety handbook which is distributed to all employees (Tr. 127, 130-131, 132-133 Adams).

On this record, complainant argues that a fallen employee suffers the hazards of (1) suffocation since a man "walking down" the stock is in a different position from one who falls and may not be able to gain his feet, or (2) serious injury if he falls on his head or he may break a limb if he strikes that part of the floor cleaned of stock.

Respondent contends that the cited standard is not applicable to these facts because safety belts do not appear to be within those protective devices envisioned and encompassed within the regulation. This, in part was the position approved by Judge Mitchell in Union Oil Company, 78 OSAHRC 21/E4 (3/9/78), BNA 6 OSHC 1433, CCH ¶22,614, affirmed on other issues in Marshall v. Union Oil Co. of California, 616 F.2d 113 (1980). At the time of the hearing of this case, October 1980, the Commission had not passed on this question.

Finally, respondent — relying on the long experience of its witnesses, the fact that there has been no injuries in the bins and that this was the inspecting officer's first exposure to a bin and could only surmise what might happen — argues that no serious physical injury could befall an employee even toppling

the six and a half feet into the stock, i.e., there is no hazard.

In the spring of 1982, a divided Commission ruled that safety belts are within the ambit of 29 CFR §1910.132(a)[4/] Bethlehem Steel Corporation, I and II, 82 OSAHRC 19/C8, BNA 10 OSHC 1470, CCH ¶25,982 (3/31/82), and 82 OSAHRC 24/B7, BNA 10 OSHC 1607, CCH ¶26,043 (4/30/82). The Commission further divided in these cases on whether the standard could apply retroactively and this turned on whether the standard and circumstances of the condition give sufficient notice to respondent that the standard must be obeyed.

In the instant case, there is no dispute that safety belts have never been worn in bins when employees are compacting the yarn. The experience of the respondent and the nature of the event are such that it never perceived the hazard as obvious as complainant argues it is. Respondent is a safety conscious company and enforces its safety policies but the great weight of the evidence smothers complainant's testimony that a hazard of such magnitude exists in these bins that safety belts are or should be a required protection. I find that the alleged hazard is not such that a reasonable person familiar with the circumstances of the activity would recognize a need for the use of the protective equipment, Ed Cheff d/b/a Ed Cheff Logging, 81 OSAHRC 60/A2, BNA 9 OSHC 1883, CCH ¶25,431, and, therefore, conclude that the broad, vague wording of the standard and the nature of employment were not sufficient to put respondent on notice that the regulation required the use of safety belts. The order below vacates the citation on this ground.

Specifically, as to the nature of hazard, I find that

1) An employee is not assigned to step down the yarn at the upper portion of the bin unless there is a great mass of the yarn, 16,000 to 18,000 pounds,

---

4/ Therefore, §5(a)(1), the general duty clause, is not applicable, 29 U.S.C. 654 (a)(1). See Bethlehem Steel Corporation II, above.

collected there;

2) This amount is enough to cushion his fall should he trip off the catwalk or lose his grip on the beam or iron rod supporting the blender (there is no evidence that employees use this as a handhold), falls of 13 to six feet, respectively, so that he would not suffer any greater serious physical harm than would be caused by a safety belt; and

3) Although when immersed in the yarn it would appear that suffocation is a possibility, the preponderance of the evidence proves otherwise. An employee buried in this light, fluffy stock would not be deprived of oxygen.

Based on these findings, I conclude that no serious[5/] violation exists in the bins at the Yantic facility. And at most the alleged violation may result in abrasions which may be termed as de minimis and having no direct or immediate relationship to safety. 29 U.S.C. §658(a). Bethlehem Steel Corporation, 81 OSAHRC 86/A2, BNA 9 OSHC 2177, CCH ¶25,645. Thus, in the alternative should 29 CFR §1910.132(a) be found to bind respondent here, I would affirm the alleged violation as de minimis with no civil penalty or requirement to abate.

Respondent's answer to the complaint admits the jurisdictional facts alleged there (see also Tr. 4) and I conclude that the Commission's power to decide this controversy is proper. 29 U.S.C. 652(5) and 653(a). Having considered the evidence and the parties' contentions on brief, it is ORDERED that the citation issued May 2, 1980, alleging a serious violation of 29 CFR §1910.132(a) be vacated together with the proposed $720 civil penalty.

David J. Knight

## NOTICE OF DECISION

Secretary of Labor v. D. C. Well Service, Inc.
OSHRC Docket NO. 81-2428

1. Enclosed is a copy of my decision. It will be filed with the Commission on September 7, 1982, and will become the final order of the Commission on October 7, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is October 7, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>D.C. WELL SERVICE, INC.,<br><br>Respondent. | OSHRC DOCKET NO. 81-2428 |

DECISION AND ORDER

Appearances: George Collins, Esq., of Dallas, Texas, for the complainant.

George R. Carlton, Jr., Esq., of Dallas, Texas, for the respondent.

PROCEDURAL HISTORY

The respondent, D.C. Well Service, Inc., [1] was operating its Rig No. 10 near Smyer, Texas, on September 1, 1981, when it was inspected by a compliance officer of the Occupational Safety and Health Administration ("OSHA"). As the result of that inspection, two citations were issued to respondent October 2, 1981, alleging one serious and one nonserious violation of §5(a)(2) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651, et seq. ("the Act") and two standards promulgated under §6(a) thereof, codified at 29 CFR 1910.27(d)(5), pertaining to ladder cages and safety devices, and 29 CFR 1910.157(d)(3)(iv), pertaining to portable fire extinguishers. On

[1] Respondent was cited as D.C. WEll Service Co., Rig No. 10. Its letterhead (see last page of Exhibit R-3) shows its name to be D.C. Well Service, Inc.

October 16, 1981, respondent timely filed notice of contest, initiating this proceeding before the Occupational Safety and Health Review Commission ("the Commission") under §10(c) of the Act. Thereafter a complaint and an answer were filed with the Commission. The case came on regularly for hearing June 27, 1982, at Lubbock, Texas. No affected employee or authorized representative of affected employees took part in the proceeding. Respondent submitted a post-hearing brief; the Secretary did not.

THE ISSUES

Respondent's answer admitted the jurisdictional allegations of the complaint. The issues remaining to be determined are:

1. Whether respondent was in serious violation of 29 CFR 1910.27(d)(5). This subsumes the issues of whether the citation and complaint should be amended to allege a serious violation of 29 CFR 1910.27(d)(1)(ii) in addition to §27(d)(5) and whether respondent has proved its affirmative defense of unpreventable employee misconduct.

2. Whether respondent was in nonserious violation of 29 CFR 1910.157(d)(3)(iv).

3. The appropriate penalty for any violations found.

DISCUSSION AND OPINION

I. <u>The ladder safety device citation.</u>

A.

Item 1 of citation 1 alleges a serious violation of 29 CFR 1910.27(d)(5) in that:

> Cage protection, or ladder safety devices in lieu of cage protection, were not used to tower, water tank or chimney ladders over 20 feet in unbroken length:
>
> > Derrickman ascends up the derrick ladder without climbing safety devices.

The cited standard provides:

> Ladder safety devices. Ladder safety devices may be used on tower, water tank, and chimney ladders over 20 feet in unbroken length in lieu of cage protection. No landing platform is required in these cases. All ladder safety devices such as those that incorporate life-belts, friction brakes, and sliding attachments shall meet the design requirements of the ladders which they serve.

The permissive language of §1910.27(d)(5) allows the use of ladder safety devices in lieu of cages on certain ladders, but for a positive requirement one must look to §1910.27(d)(1)(ii), which provides:

(d) Special requirements.

(1) Cages or wells.

* * *

> (ii) Cages or wells (except as provided in subparagraph (5) of this paragraph) conforming to the dimensions shown in figures D-7,D-8, and D-9 shall be provided on ladders of more than 20 feet to a maximum unbroken length of 30 feet.

It is apparent that these two subparagraphs must be read together, especially since §1910.27(d)(1)(ii) refers specifically to subparagraph (5). Together they require, in effect, that a cage or a ladder safety device be provided for a ladder over 20 feet in unbroken length used on a tower, water tank or chimney. This conforms to the language of the citation, and the respondent was thus on notice that it was the Secretary's position that it was required to, and did not, provide either of these protective devices. The case was fully litigated on that basis.

Moreover, the parties were informed at the hearing that §1910.27(d)(1)(ii) would probably be added to the citation by amendment and that they should adduce any evidence they had available that would be made pertinent by such an

amendment (Tr.32-34).

By letter from the undersigned dated July 9, 1982, the parties were notified that this amendment would be made sua sponte and that if they desired a supplemental hearing they should request it within a week, specifying the evidence they proposed to introduce at such a hearing. No such request was made. Therefore, the amendment will be made.

B.

Compliance Officer Placido Vigil's uncontradicted testimony establishes that a permanent metal ladder extended from the rig floor 35 feet up into the derrick (as shown by a photograph, Exhibit C-1), that the ladder had no cage or safety climibing device, and that he saw the derrickman go up and down the ladder (Tr.8,9,11,48,49).

The standard presumes a hazard, but the compliance officer testified that there had been a number of falls from tubing boards in this region (Tr.10) and that death or serious physical injury could be expected to result from such a fall, especially since the derrick floor beneath the ladder is metal and has many sharp metal objects on it (Tr.10,11).

The compliance officer was accompanied on the walkaround by the rig operator, [2] but the record is not clear as to whether the derrickman went up and down the ladder in his presence. However, the compliance officer discussed the apparent violation with both the operator and the derrickman (Tr.10),

---

[2] There is a question concerning the operator's name. Vigil had it as Richard McKane, but respondent's safety director, Richard McCance, said the operator's name was Leslie McKay. Respondent seeks to discredit Vigil's testimony on the basis of this discrepancy, which I regard as unimportant. It is possible that Vigil was confused by the similarity of the surnames McKay and McCance.

and there is no indication that the operator was unaware of the derrickman's use of the ladder. In any event, the derrickman had access to the hazard, and the respondent is chargeable with knowledge of any violative condition which existed during the inspection and was readily discernible. Weatherhead Co., 76 OSAHRC 61/E7, 4 BNA OSHC 1296, 1976-77 CCH OSHD ¶20,784 (No. 8862, 1976). Here the violative conditions is the unprotected ladder, as is discussed below.

C.

Respondent contends that an OSHA field directive approves an industry practice permitting employees to ride the hoisting equipment on oil well servicing rigs and that the act of its derrickman in using the unprotected ladder amounted to unpreventable employee misconduct.

Exhibit R-2 is Dallas Regional Instruction CPL 2-1.1, which states in pertinent part:

> C. BACKGROUND
>
> In the past, several requests have been made for a written directive allowing employees to ride the traveling blocks or elevators on well servicing rigs.
>
> A recent policy interpretation from the National Office identifies the circumstances under which employees are permitted to ride hoisting equipment on well servicing rigs. The stated policy is similar to that adopted by the Wyoming Occupational Health and Safety Rules and Regulations for Oil and Gas Well Servicing and the recommended practices of the American Petroleum Institute [API].
>
> D. GUIDELINES
>
> 1. Employee riding of hoisting equipment to attain access or egress at an elevated work station in oil and gas well servicing is allowed only in work situations when such action results in the least hazardous exposure to employees.
>
> 2. Riding of the traveling block and/or elevator is allowed only when it is the least hazardous means of hoisting or lowering employees; and is subject to the following:

a. No employee shall ride the traveling block and/or elevator when rods, tubing, or any other downhole equipment is being moved.

b. An employee riding the traveling block and/or elevator shall wear a safety or parachute type safety harness with appropriate lanyard and safety attachment anchored and adjusted to prevent a fall of more than five feet.

Exhibit R-1 is API Recommended Practices for Occupational Safety and Health for Oil and Gas Well Drilling and Servicing Operations, §4.8.3 of which contains language substantially identical to the "guidelines" stated by Exhibit R-2.

Such OSHA directives to its field personnel are not binding on the Commission when they contradict a duly promulgated standard. Bethlehem Steel Corp., 81 OSAHRC 108/A2, 10 BNA oshc 1264, 1982 CCH OSHD ¶25,839 (No. 16067, 1981). However, there may be a question of whether an employer has notice of what the standard requires. Cf., Chesapeake Operating Co., 82 OSAHRC _____, 1982 CCH OSHD ¶26,142 (No. 78-1353, 1982) (Commissioner Cleary's view). Since the respondent here is not charged with violating any standard prohibiting the use of material hoisting equipment to lift personnel, it is unnecessary to resolve the latter question.

The short answer to respondent's contention is that the unprotected ladder was available for employee use and was so used, regardless of whether the employee might have ridden the hoisting equipment. Of course, respondent contends that this amounted to unpreventable employee misconduct. It has not, however, established the elements of that defense.

Unpreventable employee misconduct is an affirmative defense wherein the employer bears the burden of proving that the actions constituting non-compliance

with the standard were (a) unknown to the employer and (b) contrary to both the employer's instructions and a company work rule which the employer had uniformly enforced. Weatherhead Co., 76 OSAHRC 61/E7, 4 BNA OSHC 1296, 1976-77 CCH OSHD ¶20,784 (No. 8862, 1976).

"Work rule" was further defined in J. K. Butler Builders, Inc., 77 OSAHRC 26/A2, 5 BNA OSHC 1075, 1977-78 CCH OSHD ¶21,585 (No. 12354, 1977), as

> . . . an employer directive that requires or proscribes certain conduct, and that is communicated to employees in such a manner that its mandatory nature is made explicit and its scope clearly understood.

Additionally, the work rule must be the equivalent of the standard the respondent is accused of violating. Kansas Power & Light Co., 77 OSAHRC 39/A2, 5 BNA OSHC 1202, 1977-78 CCH OSHD ¶21,696 (No. 11015, 1977).

Richard McCance, respondent's safety director, testified that a parachute-type belt "to ride the blocks with" was at Rig No. 10 on the date of the inspection and that employees were instructed to use it with the lanyard attached to the block to ascend the derrick (Tr.36,37). McCance was not at Rig No. 10 at the time of the inspection (Tr.40).

There was no evidence regarding any work rule or specific instructions to the derrickman not to use the ladder. Indeed, there is some indication that he could not have used the travelling block at the time of the inspection, for the compliance officer testified that the operator told him the derrick was not in use (Tr.8). Nevertheless, the derrickman apparently had a reason to ascend to the tubing board, for the compliance officer testified that the employee attached something after reaching the tubing board (Tr.49).

Respondent's safety manual (Exhibit R-3) contains no work rule on use of the travelling block to ascend into the derrick. It does, however, contain

a safety inspection checklist which includes two items pertaining to the derrick ladder and another for "Derrick ladder climbing device."

The 17-day abatement period proposed by the citation was contested, but the only testimony on this subject was the compliance officer's testimony that the operator agreed 15 days would be sufficient (Tr.15). He also quoted the operator as saying ladder climbing devices were being installed in all of respondent's rigs but that they hadn't gotten around to installing one on Rig No. 10(Tr.13). Safety Director McCance denied that any such devices were being installed by respondent (Tr.36), but it is not necessary to resolve this conflict.

D.

Respondent also contends that the language of §1910.27(d)(1)(ii) requiring cages or wells on "ladders of more than 20 feet to a maximum unbroken length of 30 feet" means that neither that standard nor §1910.27(d)(1)(i) is applicable to respondent's ladder, which was 35 feet in length. All this really means is that, when these two standards are read together with §1910.27(d)(2), respondent's ladder should have had a landing platform as well as a cage or ladder safety device. However, respondent was not charged with this additional violation.

E.

The next question is what would be the appropriate penalty for this violation, the Secretary having proposed a penalty of $420.

Section 17(j) of the Act requires the Commission, in assessing penalties, to consider the gravity of the violation and the employer's size, good faith and history of previous violations. These factors need not be accorded equal

weight, but the gravity is usually of greater significance than the others. Colonial Craft Reproductions, 72 OSAHRC 11/B10, 1 BNA OSHC 1063, 1971-73 CCH OSHD ¶15,277 (No. 881, 1972). Elements to be considered in determining gravity include the number of employees exposed to the risk of injury, duration of the exposure, precautions taken against injury, and the degree of probability of occurrence of an injury. National Realty & Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 85, 1972) rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

On balance, after considering the statutory criteria, I find the proposed penalty of $460 to be appropriate.

II. The alleged fire extinguisher violation.

Item 1 of citation 2 alleges a nonserious violation of 29 CFR 1910.157 (d)(3)(iv) in that a portable fire extinguisher did not have attached to it a durable tag showing the maintenance or recharge date.

The inspection date was September 17, 1981, and the cited standard was deleted effective December 11, 1980, in a general revision of Subpart L. See F.R. 60656, September 12, 1980.

The revised standards for portable fire extinguishers contain no counterpart for §1910.157(d)(3)(iv). Sections 1910.157(e)(3) and 1910.157(f)(16) of the revised standards do require that the employer maintain records of maintenance and hydrostatic testing dates for fire extinguishers. However, unlike the former §1910.157(d)(3)(iv) the new standards do not require that this information be recorded on a "durable tag" attached to the extinguisher.

Although the evidence clearly established that the fire extinguisher here involved had no such tag attached (Tr.17-18), it did not establish that

respondent had no records of maintenance and testing of the extinguisher as required by the standards in effect at the time of the inspection. Therefore, there is no basis for an amendment to the citation and complaint.

This item must be vacated.

## FINDINGS OF FACT

1. Respondent, D.C. Well Service Co., is in the business of servicing oil wells and is an employer engaged in commerce within the meaning of §3(5) of the Act.

2. On September 1, 1981, respondent's Rig No. 10 was servicing an oil well near Smyer, Texas, when it was inspected by an OSHA compliance officer.

3. Rig No. 10 had a fixed ladder approximately 35 feet in height which extended up into the derrick from the derrick floor to the tubing board. This ladder was an integral part of the derrick structure. It was not equipped with a cage or a ladder safety device.

4. The compliance officer observed respondent's derrickman as he used the ladder to ascend to and descend from the derrick's tubing board.

5. Respondent's employees were instructed to use a safety harness attached by a lanyard to the travelling block when ascending or descending the derrick, and one such safety harness was provided at Rig No. 10. There is no evidence that their instruction was communicated to the derrickman or that it was uniformly enforced.

6. A regional OSHA directive to field personnel permitted the use of hoisting equipment on oil well servicing rigs to lift employees into the derrick, under certain guidelines.

7. Respondent adduced no evidence that it had a work rule forbidding employees to use the derrick ladder. This ladder was accessible to employees. The derrickman did not violate any work rule or instructions in using this ladder.

8. Respondent knew or in the exercise of reasonable diligence could have known that the derrick ladder violated OSHA standards and that its employees might use it.

9. A penalty of $420 is appropriate for respondent's violation of 29 CFR 1910.§§27(d)(1)(ii) and 27 (d)(5).

10. A portable fire extinguisher on Rig No. 10 bore no durable tag showing the maintenance or recharge date.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. Item 1 of citation 1 should be amended to allege a serious violation of 29 CFR 1910 §§27(d)(1)(ii) and 27(d)(5), and on September 1, 1981, respondent was in serious violation thereof.

3. The standard formerly codified at 29 CFR 1910.157(d)(3)(iv) was not in effect on the date of the inspection herein.

## ORDER

On the basis of the foregoing discussion and opinion, findings of fact, and conclusions of law, it is ORDERED that:

1. Item 1 of citation 1 is amended to allege a serious violation of 29 CFR 1910.§§27(d)(1)(ii) and 27 (d)(5), and, as so amended, it is AFFIRMED

and a penalty of $420 is ASSESSED.

2. Item 1 of citation 2 is VACATED.

| SECRETARY OF LABOR,<br>Complainant<br>v.<br>BETHLEHEM STEEL CORPORATION,<br>Respondent | OSHRC DOCKET NO. 80-2707<br><br>DECISION & ORDER |

Appearances: For the complainant,
Francis V. LaRuffa, Regional Solicitor
U. S. Department of Labor
New York, New York
By: James A. Magenheimer, Esq.

For the respondent,
Murray N. Shelton, Jr., Esq.
Bethlehem Steel Corporation
Bethlehem, Pennsylvania

For affected employees,
John S. Choinski, Safety Chairman
Local 2601, United Steelworkers
of America
Lackawanna, New York

During the course of an inspection at the Bethlehem Steel Corporation's Lackawanna, New York, plant (respondent) on April 8, 1980, Compliance Officer Joseph P. Smith of the Occupational Safety and Health Administration of the U. S. Department of Labor (complainant or OSHA) saw a puddle of water about 15 to 20 feet from the tap side of vessel 16 which contained molten metal on the second floor. Should that metal come in contact with the water, an explosion could result sending pieces of the metal flying about the area.

Should the molten mass encapsulate (completely cover) the water, it would violently explode. (Tr.[1/] 12, 13, 17)

The puddle was 10 to 15 feet long and five to seven feet wide in places. Its depth ranged from an eighth of an inch to an inch over a relatively smooth concrete floor. (Tr. 13-14, 21) The officer was told by employees that the puddle was there for over a week. He saw four or five employees passing through the area adjacent to the water performing short tasks but no work station was located there and was advised that regularly maintenance workers, or scrap turn men, would pass and these intermittently could amount to 10 employees (Tr. 14, 18).

Mr. Smith could not find the source of the water but there are leaking pipes throughout the building. This puddle he described as standing water covered by a layer of dust (Tr. 19). It is shown as the orange mass on the first two photos of exhibit C-2 (Tr. 15). The overflow of molten metal from vessel 16 would not necessarily be retained in the rubble pit (Tr. 15, 22) and the third photo on exhibit C-2 shows the metal on the floor beyond that pit; it shoots out (Tr. 24-26) and sparks landing in the water popped (Tr. 21).

The closest the molten metal came to the water was six to eight feet which the officer saw, but, if the puddle or overflow from the vessel were larger, there would be contact (Tr. 16). When the molten metal covers the water, it turns it into steam which expands and will blow the metal all over. Only a small portion of the puddle need be encapsulated for this reaction to occur, in fact, any moisture covered will do it. He was told water and molten metal exploded six times at this facility. Water and moisture is one of the biggest hazards in the process of pouring molten metal. (Tr. 28-31)

1/ A hearing was held on January 7, 1981, and "TR" refers to transcript pages.

Mr. Smith characterized the hazard created by the water as serious[2/] for two reasons: (1) the possibility of an explosion causing injuries and burns; and (2) since there are pallets and equipment in this area, an employee slipping on the wet floor could hurt himself (Tr. 23-24). Respondent has received two prior citations alleging violations of the same standard as here and, for that reason, this alleged violation is termed as repeated[3/] (Tr. 20, 22 and exhibit C-1, the prior citations). These citations have become final orders, the parties stipulated (Tr. 6).

As a result of this inspection and investigation, a citation[4/] was issued[5/] on May 8, 1980, alleging that respondent repeatedly violated the standard at 29 C.F.R. §1910.22(a)(2) which commands

> Subpart D: Walking-Working Surfaces
>
> (2) The floor of every workroom shall be maintained in a clean and, so far as possible, a dry condition. Where wet processes are used, drainage shall be maintained, and false floors, platforms, mats, or other dry standing places should be provided where practicable.

A civil penalty of $2,400 was proposed[5/] and the allegedly hazardous condition was to be abated[5/] within one week. Respondent contested[6/] the citation by letter dated May 13, 1980.

---

2/ A serious violation exists where there is a substantial probability that death or serious physical harm could result from the condition and the employer knew or, with the exercise of reasonable diligence, should have known of the presence of the violation. Occupational Safety and Health Act of 1970, 29 U.S.C. §§651, et seq., at §666(j).

3/ A repeated violation may carry a civil penalty of up to $10,000. 29 U.S.C. §666(a).

4/ Two citations were issued and contested in their totality. All but the item at issue here (citation 2, item 1) were settled by the parties at the outset of the hearing. These are disposed of in the order below.

5/ Under 29 U.S.C. §658(a). Penalties may be assessed under §659(a) and abatement periods set under §658(a).

6/ Contests must be filed within a 15 working-day period, 29 U.S.C. §659(a), and, thereafter, a hearing is set, §659(c). At this hearing, all parties were represented and complainant and respondent filed their briefs by March 2, 1981.

It presented two witnesses. Jerome Wise, Assistant Superintendent of the Steelmaking Division for the past three and a half years and who has worked in the BOF (basic oxygen furnace) for 15 years, testified that it is impossible to keep the floors dry at all times. Water leaks from broken pipes and pumps and a general cleaning process. This puddle resulted from a clogged drain on the floor above. This happens occasionally in this area but these situations are corrected. In any event, this puddle was not more than a quarter inch deep. (Tr. 32, 33, 37-38, 40, 45) They did not know how long this water was there (Tr. 36) but, over his three and a half years at Lackawanna, it has happened about 24 times and at times it requires a couple of days before it is cleaned up (Tr. 42). Refining steel is not a wet process and an employee would not stand in the water to work (Tr. 36). He would also easily walk around the puddle and there exists no slipping hazard because the floor is of rough concrete (Tr. 33-34).

Mr. Wise doubted that the water would be involved in an explosive situation because: Firstly, the area of the puddle is to the south and the molten metal in a heavy flow, or slopping, would travel into the rubble pit and then eastwardly or westwardly (Tr. 34-35). And secondly, a heavy roll off would push the water before it, turn it into steam and dry it up (Tr. 35-36, 46). There would be no encapsulization for, to accomplish that, the metal must come from above (Tr. 36, 47). Only an encapsulation could lead to an explosion. Here there would be popping as sparks hit the water. (Tr. 46, 47) No one would be injured and there has never been an explosion in this area (Tr. 48-49). He has seen such explosions but no injuries resulted (Tr. 42-43).

Joseph P. Eagan is respondent's Senior Corporate Safety Engineer and testified that the source of the standard cited against respondent is

ANSI Z 4.1-1968 (American National Standards Institute), section 3.1.2 and deals with sanitation not safety. Its purpose is to prescribe minimum sanitary requirements to protect health (§1.2) and "sanitary condition" is a status to prevent the incidence and spread of disease (§2). This standard was not intended to be applied to slipping or exploding hazards. (Tr. 50-54) Steelmaking is not a wet process (Tr. 54). On cross-examination, Mr. Eagan admitted that Subpart D of the OSHA standard covers walking and working surfaces and another section or subpart regulates sanitation (Tr. 55).

Finally, with regard to the repeatedness of the alleged violation, respondent elicited from Compliance Officer Smith that the second of the two prior citations was a non-serious violation (Tr. 20, exhibit C-1) for a wet and slippery surface and did not have a reference to molten metals. He did not know if the first of these referred in any way to the metals (Tr. 22, 23) but there is no hot metal on the sixth floor of the BOF, according to Mr. Wise, the area cited in the first of these citations (Tr. 33).

In rebuttal, John S. Choinski, the affected employee representative, called George A. Brenner, this plant's Superintendent of Steelmaking, who testified that the preventive maintenance program is based on rebuilding equipment to be sure it is all tight. If a leak occurs, corrective measures are taken. But pipes, subject to freezing and bursting, are not wrapped and protected by trace lines and these could burst. (Tr. 57)

The plant has experienced two explosions involving molten metal and moisture at other sections of the BOF (the pit area)--one destroying a crane and injuring an employee and the other shattering windows with no injuries--but in these instances the molten metal covered, not a wet floor, but damp soil (Tr. 58-59, 61-62). Mr. Brenner acknowledged that the union has complained

about the presence of water in the BOF but it is not the greatest safety problem (Tr. 58, 60) and at one time the complaint was directed to footwear worn on wet floors (Tr. 61).

But Mr. Choinski, who has represented employees for 10 years as their safety agent and who works at the plant, testified that water and molten metal is the biggest safety problem in the BOF; he has seen violent explosions resulting from their contact with each other; but the respondent's response to the union's complaints on this subject is that the accumulation of water is a "continuing problem" (Tr. 63). In Mr. Choinski's opinion, there is no such thing as a non-serious violation concerning water and molten metal (Tr. 64).

FINDINGS AND CONCLUSIONS:

Based on this record and having considered the parties' post-hearing proposed findings and conclusions (as these may be contained in their briefs), I find:

1) The puddle of water described by Compliance Officer Smith on the second floor of the BOF does not create a tripping or slipping hazard because

a) No employee passes through or works in it;

b) The floor is made of rough concrete and would not be slippery; and

c) There is no evidence that employees come in contact with the water but only pass by with ample room to do so.

2) The potential for an explosion is so remote as to be non-existent because

a) The molten metal, although it was seen outside the rubble pit, would tend to flow not in the direction of the water, south, but to the east or west and the Compliance Officer saw it no closer than six feet;

b) Unless completely encapsulated, there is little probability of an explosion or violent reaction but some popping from sparks;

c) The molten metal, a large amount, flowing toward the water would push and heat it until the water evaporated or steamed off; and

d) Encapsulation, leading to an explosion, it is reasonable to believe, therefore, must result from a drop of the molten metal from above onto, covering and capturing the water.

For these findings I accept the testimony of Mr. Wise as supported by his years of experience in the BOF and this overcomes the conclusions offered by Compliance Officer Smith's evidence indicating opposite effects from the presence of the water some 10 to 15 feet away from vessel 16. I do not find the latter's testimony persuasive and respondent's evidence refuted the inferences created.

But this is not to say that the standard requiring floors to be kept in a dry condition has not been violated. A preponderance of the evidence leads to the findings

1) The puddle existed for at least a week according to the unrebutted evidence of the Compliance Officer;

2) While leaking pipes, pumps and blocked drains appear to be a common condition, no action was taken by respondent to clear the water to prevent a build-up while the drainage problem on the floor above was attended to. No clean-up work would be done at all until the drain over this area was cleared according to the respondent's evidence. Thus, the floor was not kept as dry, or the water contained, as could be possible; and

3) Employees, up to 10, are in the area on an irregular basis and could be struck by popping sparks from the molten metal falling into the puddle.

The evidence shows that any injuries would be superficial and the evidence is less than convincing that serious burns could result from these pops.

Complainant's burden of proof under the housekeeping standards, 29 C.F.R. §1910.22(a), is to show a condition violating the standard's requirement and employee exposure to that. Thereafter, the hazard is presumed. Bunge Corp. v. Secretary of Labor, 638 F.2d 831 (1981) at 835. I conclude that the complainant has carried this burden to the extent that an other than serious violation has been proven.

By this same token, the prior two violations in May 1973 and September 1974, respectively, concern floors not kept as dry as possible; these are final orders; and this citation may properly be deemed as a repeat of the prior accusations even though, and I find that, the hazards are different, the violations occurred in other areas, and there is no showing that the prior violations involved exposure of molten metal to water. The hazard presented bears on the civil penalty when the violation is of a standard requiring the maintenance of a specific condition, dry floors. Therefore, respondent's attempt here to show a disparity between this and the prior citations, which is its burden, does not hold. See Bunge, above, at 836-837, and that Court's interpretation of the Commission decision in Secretary v. Potlatch Corp., 79 OSAHRC 6/A2, BNA 7 OSHC 1061, CCH ¶23,294, which defines a repeat violations generally in these terms.

The parties stipulated that $2,400 proposed civil penalty meets the statutory criteria, 29 U.S.C. §666(i), except for the element of the gravity of the violation (Tr. 10-11). As found above, the nature of any injury which might occur is not serious and employees are not constantly exposed to the hazard in the area of the puddle. The order below affirms the citation as repeated and non-serious. A civil penalty of $240 is assessed.

Lastly, the cited standard is applicable to the area cited. Respondent's evidence (exhibit R-2, the ANSI Standard) that this is a health and not a safety requirement is not well taken. Under the Act, the Secretary must promulgate any national consensus standard (ANSI) as an occupational safety and health standard

> ...unless he determines that the promulgation...would not result in improved safety or health...29 U.S.C. §655(a)

This standard the Secretary adopted verbatim and made it applicable to circumstances of health and safety. This does not violate his statutory duty. Cf., Modern Drop Forge Company v. Secretary of Labor, No. 81-1579 (7th Cir., July 26, 1982), BNA 10 OSHC 1825. And it serves to enhance the purpose of the Act in promoting "safe and healthful working conditions," 29 U.S.C. §651(b), without violating any notice due process. In Bunge, above, the Court dismissed the argument that this subpart deals only with housekeeping and may not be expanded to include fire and explosion rather than tripping and slipping. The Court found that the condition is determinative, not the hazard created by that condition. Bunge at 834 and footnote 4.

The Commission rejected the respondent's contention that this section governs only disease prevention and may not be stretched to encompass tripping hazards. It ruled that the requirement of keeping places of employment "in a sanitary condition" is in addition to maintaining them as "clean and orderly." 29 C.F.R. §1910.22(a)(1). And the Commission had the ANSI source standard before it. Secretary v. Pratt & Whitney Aircraft, 81 OSAHRC 39/A2, BNA 9 OSHC 1653, CCH ¶25,359.

Respondent here was properly cited under 29 C.F.R. §1910.22(a)(2) for the alleged tripping and exploding hazards.

**ORDER:**

Based on these findings and conclusions and respondent, in its answer, admitting the jurisdictional facts alleged in the complaint so that the Commission's jurisdiction is established, 29 U.S.C. §§652(5) and 653(a), it is ordered that

(1) The citation (No. 2, item 1) issued May 8, 1980, alleging a repeated violation of 29 C.F.R. §1910.22(a)(2) is affirmed as a repeated, non-serious violation with a civil penalty of $240 assessed therefor; and

In accordance with the motions, agreements, and stipulations among the parties (Tr. 4-6):

(2) Citation No. 1, items 3, 4, and 5 are affirmed with civil penalties of $250, $250 and $200, respectively, assessed therefor; and

(3) Citation No. 2, items 2, 3 and 4 are affirmed with civil penalties of $1,400, $2,500 and $400, respectively, and item 3a is amended to read: "B.O.F.-#17 vessel--tap side-2d floor, <u>during rebuilds</u>" (underscored language added).

# NOTICE OF DECISION

**SECRETARY v. ANHEUSER-BUSCH, INC.**

**OSHRC Docket No. 79-5002**

1. Enclosed is a copy of my decision. It will be filed with the Commission on September 9, 1982, and will become the final order of the Commission on October 12, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupationsl Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is October 12, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

APPEARANCES:

Stephen J. Simko, Jr., Esquire, Office of the Solicitor, U. S. Department of Labor, Atlanta, Georgia, on behalf of complainant.

A. Graham Allen, Esquire, Freeman, Richardson, Watson, Slade, McCarthy, & Kelly, P.A., Jacksonville, Florida, on behalf of respondent.

## DECISION ON REMAND

Burroughs, Judge: The Commission by order dated May 19, 1982, remanded this case for further proceedings consistent with the opinion of the United States Court of Appeals for the Eighth Circuit. The court reversed a decision by former Administrative Law Judge J. Paul Brenton vacating an "other" citation that alleged a violation of 29 C.F.R. § 1910.23(c)(1), for failure to erect railings around the top of pasteurizers in respondent's Jacksonville, Florida, brewery. Donovan v. Anheuser-Busch, Inc., 666 F.2d 315 (8th Cir. 1981), reh'g denied, 666 F.2d 328 (1982). While the court held the tops of pasteurizers were "platforms" within the meaning of 29 C.F.R. § 1910.21(a)(4), and affirmed a violation of 29 C.F.R. § 1910.23(c)(1), it remanded the case for purposes of determining whether the violation should be classified as de minimis.

The case was assigned to this Judge on May 25, 1982. On May 28, 1982, an order was issued requiring the parties to advise if they had any objection to deciding the issue of whether the violation should be classified as de minimis on the facts of record. Both parties advised that they had no objection to deciding the issue on the facts of record and that they desired to submit briefs on the question for determination. The parties were granted until July 16, 1982, to submit briefs, and briefs were received from both parties no later than July 16, 1982.

The findings of fact, to the extent made by Judge Brenton, are supported by the evidence of record and are accepted for purposes of resolving the dispute; however, he did not make crucial findings of fact as to actual conditions which existed on top of the pasteurizers. Since conditions on top of the pasteurizers have a direct relationship to the safety of employees, additional findings of fact have been made from the evidence of record to reflect actual working conditions to which employees are exposed during the course of performing assigned duties on top of the pasteurizers.

Anheuser-Busch, Inc., operates a brewery in Jacksonville, Florida. The equipment in the brewery includes four "can-line" pasteurizers.[1/] Each "can-line" pasteurizer is 25 to 30 feet in width, approximately 6 feet in height and about 100 feet in length. The tops of the pasteurizers are essentially flat and are composed of a series of stainless steel lids or plates that are removable. Spray heads are located under the lids. Each lid is five feet in length and two feet in width and has an "L" shaped handle at each end for lifting purposes. The lids are laid out in nine

---

1/ The citation pertained to seven pasteurizers which included three "bottle-line" pasteurizers. Respondent contested the guardrail requirement only for the "can-line" pasteurizers.

parallel rows, each row containing 18 plates. The layout of each "can-line" pasteurizer is almost identical.

Several different classifications of employees have occasion to be on top of the pasteurizers during the course of their employment. Laboratory technicians perform a number of different functions on a rotating basis. One of their duties involves checking the spray heads in the pasteurizers. This operation is performed on top of the pasteurizer by two laboratory technicians. One of the technicians raises each lid while the other looks inside to check the spray heads. Each "can-line" pasteurizer is inspected for this purpose at two-week intervals. The time each laboratory technician estimated was spent on top of each of the pasteurizers for inspection varied slightly but was estimated to be between 40 and 60 minutes. They were consistent in their testimony that approximately one-fifth of their time was spent "near the edge" of the pasteurizer.

Production personnel are involved in two operations that are generally performed on top of the pasteurizers. They wash and mop the tops of the pasteurizers once each week. The mops have five-foot handles. The cleaning operation takes approximately one hour. Judge Brenton found their exposure to the perimeter, if any, during the cleaning operation to be miniscule.

Production personnel are also involved in carrying aluminum "logs" on top of the pasteurizers. The "logs" are placed on the conveyor belt as the beer enters the pasteurizer to separate changes in the lid type. The "logs" are approximately ten feet in length and weigh from six to eight pounds. As the "logs" exit the pasteurizer, they are placed on top of the pasteurizer at the discharge end. At periodic and infrequent intervals, an employee will ascend to the top of the pasteurizer and carry the "logs" from the discharge end to the entrance of the

pasteurizer. The employee performing this duty will generally walk down the middle of the top of the pasteurizer. Judge Brenton determined that employees performing this duty are never closer than ten feet to the perimeter of the pasteurizer. These same employees occasionally ascend to the top of the pasteurizers to look inside to see when a "log" will be coming out. This duty is performed only when requested by the foreman. Judge Brenton found that the two duties performed by production personnel on top of a pasteurizer required only ten minutes per day.

Maintenance personnel ascend the top of a pasteurizer to repair spray heads. The maintenance work is performed on a "need" basis instead of a regular scheduled basis. Generally, performance of maintenance work is determined by the number of spray heads which need attention. While repairing the spray heads, the mechanic is usually standing inside the pasteurizer up to his hips. This kind of repair operation can occur once or twice a week and is usually performed on weekends when the pasteurizers are shut down.

The cited standard, 29 C.F.R. § 1910.23(c)(1),[2/] clearly prescribes that guardrails shall be provided to protect employees from open-sided platforms four feet or more above an adjacent floor. The standard by its plain terms assumes the existence of a hazard, but noncompliance does not necessarily establish a

---

2/ Section 1910.23(c)(1) of 29 C.F.R. provides, in pertinent part:

> Protection of open-sided floors, platforms, and runways. (1) Every open-sided floor or platform 4 feet or more above adjacent floor or ground level shall be guarded by a standard railing (or the equivalent as specified in paragraph (e)(3) of this section) on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. . . .

nonserious violation of the Act, as is alleged in this case. If the hazard does not have a direct or immediate relationship to occupational safety or health, the violation is de minimis. Lee Way Motor Freight, Inc., 74 OSAHRC 22/D12, 1 BNA OSHC 1689, 1973-74 CCH OSHD ¶ 17,693 (No. 1105, 1974), aff'd 511 F.2d 864 (10th Cir. 1975).

The Commission has held violations of the Act to be de minimis where the hazards presented were too "trifling to warrant the imposition of an abatement requirement or the assessment of a penalty." Southwestern Electric Power Co., 80 OSAHRC 81/C7, 8 BNA OSHC 1974, 1975, 1980 CCH OSHD ¶ 24,732 (No. 77-3890 and 77-3891, 1980). In classifying a violation as de minimis, the Commission has considered the nature of the hazard as well as the likelihood of an accident. Fabricraft, Inc., 79 OSAHRC 49/A2, 7 BNA OSHC 1540, 1979 CCH OSHD ¶ 23,691 (No. 76-1410, 1979). In Fabricraft, Inc., supra, the Commission found that some hazard existed from unguarded needles but noted that the only two puncture injuries occurring from 1971 to July 1976 were minor. The fact that only two injuries occurred during this period indicated that the likelihood of an injury was remote.

In National Rolling Mills Co., 76 OSAHRC 121/D7, 4 BNA OSHC 1719, 1976-77 CCH OSHD ¶ 21,114 (No. 7987, 1976), the Commission held a violation of 29 C.F.R. § 1910.22(c), which requires covers or guardrails to protect employees from the hazard of a pit, was de minimis. The Commission stated (4 BNA OSHC at 1721):

> We conclude that the hazard here was, at most, trifling. Particularly persuasive in this regard are the brief periods of exposure, the short fall distance of three feet, and the precautions taken by Respondent in its installation of all-grip plates and its enforcement of the use of nonskid shoes. In these circumstances, we conclude that the violation was of a de minimis nature and does not warrant a requirement of abatement or the imposition of any penalty.

In Van Raalte Co., Inc., 76 OSAHRC 48/B8, 4 BNA OSHC 1151, 197576 CCH OSHD ¶ 20,633 (No. 5007, 1976), the Commission made reference to the fact that no injuries had occurred in the last 38 years as a result of the condition. At the same time, the Commission pointed out in a footnote that this fact "is not necessarily controlling" since a hazard may be found to exist in the absence of any recorded injuries.

Employees are required to be on top of the pasteurizers for various functions associated with their employment. Laboratory technicians must work near the perimeter of the pasteurizer (Tr. 92, 117), since they must lift the lids to check the spray heads. The lids are within four to six inches of the perimeter on the sides of the pasteurizer (Ex. R-1, R-2, R-3, R-5; Tr. 76). The lifting hooks, which are clearly visible in the photographs introduced in evidence as exhibits R-1 and R-2, present a tripping hazard to a careless employee. An employee tripping on the lifting hooks on the lids at the perimeter of the pasteurizer would likely fall off the top.

Production personnel wash and mop the pasteurizers once each week. They have to perform some of this work in close proximity to the perimeter since the mop handles are only five feet in length. A solution of soap and acid is used to clean the top (Tr. 52), and the solution makes the lids, as described by one of the employees, "mighty slippery" (Tr. 105). There is always the possibility of an employee engaged in this type work slipping near the perimeter and sliding over the perimeter. The lifting hooks also present a tripping hazard to employees engaged in this activity.

There is evidence that slime has a tendency to accumulate on the lids at the rear of the pasteurizer (Tr. 42, 49-50, 92, 106). This tends to make the lids slippery.

There is also evidence that some of the lids on top of the pasteurizers are warped or bent (Tr. 37). This condition creates another tripping hazard. Evidence was also presented to show that whenever the spray heads burst, some of the water gets to the top of the pasteurizer through the cracks between the lids (Tr. 41, 112). The water would have a tendency to make the surface slippery.

Joseph Gamber, a maintenance mechanic, testified that it was not uncommon to slip while on the top of a pasteurizer (Tr. 29-30). Milton Hannon, Sr., a laboratory technician, testified that while he had not fallen off of a pasteurizer, he had fallen into one (Tr. 50, 51). While a guardrail will not protect against a fall into a pasteurizer, the incident does indicate that employees do fall while on top of a pasteurizer. It may have been fortunate for Hannon that he fell on the top in the interior of the pasteurizer and not at the perimeter. There is no way respondent can insure that no falls will ever occur at the perimeter.

While the laboratory and production personnel have only brief periods of exposure to the perimeter during a workweek, the existence of slippery conditions and tripping hazards increases the possibility of an unexpected fall. There is no evidence that employees were required to wear nonskid shoes or take any precautions to alleviate the possibility of a fall. At least one employee testified that he wore no type of safety shoes while on the top of the pasteurizer (Tr. 117), and a second employee stated that his shoes were suppose to be safety shoes (Tr. 92).

The evidence does not indicate that anyone has fallen from the top of a pasteurizer since the brewery has been in operation. This fact is commendable, but it is not persuasive of the issue. "One purpose of the Act is to prevent the first accident." Lee Way Motor Freight, Inc. v. Secretary of Labor, 511 F.2d 864, 870

(10th Cir. 1975). In the event an employee fell or slipped at the perimeter, he would be exposed to a fall of six feet to the floor. Depending on how he tripped or slipped, he could fall head first. An injury reulting from such a fall would certainly not be trifling. Accordingly, the violation is determined to be nonserious as alleged in the citation.

## FINDINGS OF FACT

1. The "can-line" pasteurizers in respondent's Jacksonville, Florida, brewery are 25 to 30 feet in width, 6 feet in height and approximately 100 feet in length.

2. The tops of the pasteurizers are flat and are composed of a series of stainless steel lids that are removable. Each lid is five feet in length and two feet in width. The lids have an "L" shaped handle at each end for lifting purposes. The handles protrude above the walking surface of the lids.

3. Several different classifications of employees have occasion to be on top of the pasteurizers during the course of their employment. Laboratory technicians and production personnel are required to perform certain work that necessitates their being near the perimeter for brief periods during the course of a workweek. Maintenance personnel may have to walk near the perimeter of the top of the pasteurizers if spray heads located along the perimeter are in need of repair.

4. The top of the pasteurizers are slippery during the washing and scrubbing of the lids by production personnel.

5. Slime sometimes accumulates on the lids at the rear of the pasteurizer.

6. Whenever spray heads burst, water gets on the top of the lids.

7. Some of the lids on the pasteurizers are warped or bent.

8. Employees have in the past slipped while on top of the pasteurizer.

## CONCLUSIONS OF LAW

1. Respondent, at all times material hereto, was engaged in a business affecting commerce wihin the meaning of section 3(5) of the Act.

2. Respondent, at all times material hereto, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and of the subject matter herein.

3. The violation of 29 C.F.R. § 1910.23(c)(1) has a direct relationship to the safety of employees working on top of the pasteurizer. The violation is properly classified as nonserious.

## ORDER

Based upon the foregoing findings of fact and conclusions of law, it is

ORDERED: That the violation of 29 C.F.R. § 1910.23(c)(1) is nonserious.

Dated this 9th day of September, 1982.

## NOTICE OF DECISION

Secretary of Labor v. Strathmore Paper Company
OSHRC Docket No. 81-1553

1. Enclosed is a copy of my decision. It will be filed with the Commission on September 14, 1982, and will become the final order of the Commission on October 14, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is October 14, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

|---|---|---|
| SECRETARY OF LABOR, | : | |
| Complainant | : | |
| v. | : | OSHRC DOCKET NO. 81-1553 |
| STRATHMORE PAPER COMPANY, | : | DECISION & ORDER |
| Respondent | : | |

Appearances: For complainant,
Albert H. Ross, Regional Solicitor
U. S. Department of Labor
Boston, Massachusetts
By: Ronald C. Glover, Esq.

For respondent,
Olaf Larsen, Esq.
Berndt, Antonellis & Larsen, P.C.
Westfield, Massachusetts

Respondent, Strathmore Paper Company of Woronoco, Massachusetts, contests[1/] the $300 civil penalty assigned to a citation setting forth a violation of the safety standard 29 CFR §1910.261(a)(3)(vii)[2/] concerning two freight elevators at this mill not equipped with interlocked car gates. That standard incorporates by reference the American National Standards Institute's (ANSI)

1/ Under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§651, et seq., citations, alleging violations, proposing penalties, and setting abatement dates are issued under §§658(a) and 659(a). A respondent may contest any or all of these aspects within a 15-working-day period and an alleged violation not contested becomes a final order by operation of law, §659(a). The citation was issued May 22, 1981, and respondent's contest is dated June 15, 1981.

2/ 29 CFR §1910.261, et seq., governs pulp, paper and paperboard mills. Respondent operates such a mill. (Stipulated Fact 11)

Safety Code for Elevators, Dumbwaiters and Moving Walks, A17.1-1965 as supplemented, rule 204 which requires:

> Rule 204.4a Where required
> A door or gate shall be provided at each entrance to the car.
> Rule 204.4b Car-Door and Gate Electric Contacts
> Each door or gate shall be equipped with a car-door or gate electric contact conforming to the requirement of Rule 111.5, so located as to be inaccessible from inside the car.

The parties stipulated the facts and filed briefs by January 5, 1981. Freight elevators #3 in storage building 8 and #4 in the storage loft were not equipped as required by these rules (Facts 18, 24 and 46).

Freight elevator #3 is controlled by push buttons, serves four floors, has six entrances, a capacity of two tons, and travels at the rate of 50 feet a minute (Facts 19, 31 and 32). Each entrance (7 feet 8 inches wide) is completely covered by a bi-parting door which cannot be opened when the car is not at that landing (Fact 21). In a normal work day, five to ten employees will use this elevator (Fact 23).

Freight elevator #4 serves two floors, has three entrances, a capacity of 2,800 pounds, travels at a rate of 50 feet per minute powered by electricity and is controlled by a shippers rope (Facts 25 and 33). A pull downward sends the elevator up to its second landing; a pull up returns it to the first; and the movement cannot be stopped unless the rope is pulled (Fact 34). Wooden slot-gates, not completely covering each entrance, are interlocked (Fact 27). Normally, up to four employees use this elevator (Fact 29).

From stipulated facts 37 and 39, describing photo exhibits 1 through 4, open areas are shown on elevator #3 between the front of the car and the stationary wall (exhbit 2); and, on elevator #4, there is an open area between the floor of the elevator and a horizontal girder at the second floor landing

(exhibit 4). From these stipulations and exhibits, I find that should an employee's limb be caught in these open areas between the moving elevator and stationary fixtures in either elevator, broken bones or amputations would be the result. This condition exists because neither elevator is equipped with a door or gate on the car to prevent access to the open areas.

This mill was inspected by OSHA on October 2, 1972, November 22, 1976, and February 6, 1979. No citations issued concerning these elevators (Facts 47 and 48). The elevators have been inspected by the appropriate agencies of the Commonwealth of Massachusetts and certificates or licenses have been issued (Fact 56).

Contentions of the Parties:

Respondent, relying on the prior OSHA inspections with no citation issued, claims that it had every reason to believe it was in compliance with the OSHA regulations. With three prior and thorough inspections finding no fault with the elevators, respondent contends that any penalty now is arbitrary and a miscarriage of justice. Furthermore, since Massachusetts certified the use of these elevators, respondent should not be fined by one Agency (OSHA) for relying on another (Massachusetts).

Nor, claims respondent, should the violation be classified as serious.[3/] There have been no accidents and the classification is a judgment by OSHA, perhaps, based on what may have happened at other facilities.

Finally, respondent stresses its good faith in cooperating with OSHA and abating all violations including this item. It seeks to have the penalty eliminated and the status of the violation reduced to non-serious.

3/ A serious violation exists where there is a substantial probability that death or serious physical harm could result from the condition cited and the respondent did not know nor, with the exercise of reasonable diligence could not have known, of the violation. 29 U.S.C. §666(j).

Complainant argues that a serious accident could (footnote 3, above) occur. It need not prove that it will happen. Further, the Commission has interpreted that for a respondent to "...know of the presence of the violation," 29 U.S.C. §666(j), means to know of the physical condition existing and not of the OSHA standard forbidding it. Here it cites Secretary v. Southwestern Acoustics & Specialty, Inc., 77 OSAHRC 25/E7, 141/D10; BNA 5 OSHC 1091; CCH ¶21,582, where the Commission points out, "Knowledge of the requirements of the law is a pertinent factor in determining whether a violation is "willful"...".

Respondent knew or could have known of the physical condition of these elevators. It stipulated the facts showing the obvious conditions and that employees regularly rode the lifts. Complainant insists that respondent knew of both the violative condition and the standard proscribing it since on February 25, 1981, three months before the issuance of this citation, it was issued a citation involving this same standard for a freight elevator at its Turner Falls, Massachusetts, mill. Respondent contested that citation and the matter was settled by agreement dated October 23, 1981, as the instant case was yet pending. See Strathmore Paper Company, OSHRC Docket No. 81-732. Clearly, argues complainant, respondent had the requisite knowledge.

And respondent's reliance on prior OSHA inspections of this mill and the certifications of the elevators by state officials does not exonerate it or prove that it lacked knowledge, states complainant citing Secretary v. GAF Corporation, 81 OSAHRC 29/A2, BNA 9 OSHC 1451, CCH ¶25,281 and Secretary v. Holman Erection Co., Inc., 77 OSAHRC 4/E10, BNA 5 OSHC 2079, CCH ¶22,318. The primary responsibility for compliance is placed squarely on the employer by the Act, 29 U.S.C. §654(a)(1) and (2). This duty exists regardless of prior

inspections and an employer cannot rely on these to deny knowledge of a hazard. The Commission must determine if violations exist and it cannot be bound by prior inspections by the various agencies.

Complainant seeks affirmance of the violation as serious and the proposed $300 civil penalty.

Conclusions and Order:

Respondent's reliance on prior inspections by federal and state officials and on its accident-free history to absolve itself from the stigma of a serious violation and penalty is an attempt to shift the onus of responsibility placed by the Act

> Each employer--shall comply with occupational safety and health standards promulgated under this Act. 29 U.S.C. §654(a)(2).

to those charged with enforcement. To conclude as respondent would have it would be to say that respondent did not know of the requirements of the standard, did not comply with them, was not found out, and, therefore, its failure to observe its duty is excusable. Stated differently, if a tree falls in a forest and no one is about, it makes no noise. But it is bound to know the requirements, obey them, and failing that to be properly charged for the failure.

Respondent's believing itself to be in compliance, for whatever reason, goes to its good faith; such a belief even erases the willfulness of an alleged violation, Secretary v. Wright & Lopez, Inc., 80 OSAHRC 36/A2, BNA 8 OSHC 1261, CCH ¶21,461. But it does not absolve the violation. Regardless of the belief, the Act specifies what must be done. Respondent here has not been diligent as that term has been defined.

> ...reasonable diligence implies, as between the employer and employe, such watchfulness, caution, and foresight as, under all the circumstances of the particular service, a corporation controlled by careful, prudent officers ought to exercise.
> Wabash Ry Co. v. M'Daniels, 107 U.S. 454 (1883) at 460, 2 S.Ct. 932 at 938, 27 L.Ed. 605.

What respondent "ought to exercise" has been set by the Act and with reasonable diligence, i.e., reading the standards, it would have known of the necessity for car gates.

The hazardous conditions--open spaces between a moving elevator and fixed walls or structural beams--is obvious from the photo exhibits and would be to any prudent person on the lift. Why no citations issued as a result of the prior inspections or how state certification was obtained in view of this condition are questions not answered by this record. But here it is not a question because the violation is admitted. The violative conditions are open and admitted.

> Indeed, "if there was a reason hidden from the ordinary mind why this condition of things must have existed, those facts called upon the defendant to make that reason known."
> Salem v. United States Lines Company, 370 U.S. 31 (1962) at 37, 82 S.Ct. 1119 at 1123.

But nothing here has been made known.

If the prior citationless inspections and state certifications are treated as expertise indicating that no hazard existed on the elevators and, therefore, respondent could not have known of the dangerous condition and would not be liable to a serious citation now, the Commission is not bound by that conclusion where the potential danger is fairly obvious. Salem v. United States Lines Company, 370 U.S. at 36, 82 S.Ct. at 1123, and at footnote 6, idem.

I find, based on the conditions described in the stipulated facts, that the open spaces on the unguarded elevators could lead to fracture or amputation should an employee's limb be caught.

I conclude the respondent knew of this obvious condition and could have known with the exercise of any diligence of the required protections. Taking administrative notice of the citation of February 25, 1981, citing this standard

at another of respondent's facilities, it did know of the existence of this standard when this citation was issued. This citation is properly characterized as serious.

The parties stipulated the jurisdictional facts (Nos. 8-13) and I conclude that it is an employer having employees and affecting interstate commerce so that the Commission's jurisdiction is proper. 29 U.S.C. §§652(5) and 653(a). They also stipulated that respondent's size is not relevant to the penalty consideration[4/] (Fact 54). It has never been issued any repeated or willful citations (Fact 55). From this, I infer that it cooperates with OSHA and abates conditions quickly so that its good faith is high since it also appears that inspections occur almost regularly.

Thus the gravity of the violation--the nature of the injuries and up to 14 employees exposed each day--is high as is respondent's good faith. Respondent, resting on the results of the prior inspections, may have relaxed its diligence in bringing these elevators into compliance but this should not be used against it. I conclude, balancing these factors, that a civil penalty of $150 is appropriate.

Based on the foregoing, it is ordered that the citation issued May 22, 1981 (item 1) is affirmed as a serious violation of 29 CFR §1910.261(a)(3)(vii) and a civil penalty of $150 is assessed therefor.

DAVID J. KNIGHT
Judge, OSHRC

Dated: September 14, 1982
Boston, Massachusetts

4/ The components of penalty computation are the (1) gravity of the violation, (2) size, (3) history of previous violations, and (4) good faith of the respondent. 29 U.S.C. §666(j).

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| CONSOLIDATED RAIL CORPORATION<br>Petitioner<br>v.<br>SECRETARY OF LABOR<br>Respondent | DOCKET NUMBER 82-658-P |

DECISION AND ORDER

Sommer, Judge

On December 15, 1981, Petitioner was issued a citation for an alleged violation of the standard at 29 C.F.R. § 1910.22(a)(2) alleging failure to maintain the floor of a workroom, so far as possible, in a dry condition. The abatement date set forth in the citation was January 4, 1982.

Subsequently, a petition for modification of abatement date was granted extending the abatement date to June 1, 1982. On June 4, 1982, a second petition for modification of abatement date was filed requesting an extension to August 31, 1982. The Secretary opposes the extension on the ground that the request was untimely filed under Commission Rule 34, 29 C.F.R. § 2200.34. Furthermore the Secretary alleges that the failure to complete was not beyond the reasonable control of petitioner.

A hearing was held in Columbus, Ohio on July 27, 1982. The Secretary was represented by Mark D. Katz, Esquire and the Petitioner was represented by Mark E. Lichty, Esquire. Neither party filed a brief herein.

The general issue to be determined is whether the Petitioner timely filed his petition for modification of the abatement period.[1/] If the petition was untimely filed the further question to be resolved is whether Petitioner made "a good faith effort to comply with the abatement requirements of [the] citation" and "abatement has not been completed because of factors beyond [its] reasonable control."[2/]

There is no dispute that the petition herein which was filed on June 4, was untimely filed (its due date under Rule 34 was June 2). Therefore the factual questions remaining are whether Petitioner has shown "a good faith effort to comply with the abatement requirements and that abatement has not been completed because of facts beyond his reasonable control."

The burden of justifying the extension rests upon the Petitioner. Section 10(a) of the Act; Commission Rule 34, 29 C.F.R. § 2200.34(d)(3).

The evidence is persuasive that the petitioner has not met its burden. Counsel for the Petitioner admitted in his opening statement that failure to abate the violation, and even the late filing was due to what was called a "lack of corporate communication." Of course this nicety hardly rises to the

---

1/ 29 C.F.R. 2200.34(c), Petition for modification of abatement period provides:

> c) A petition for modification of abatement date shall be filed with the Area Director of the United States Department of Labor who issued the citation no later that the close of the next working day following the date on which abatement was originally required. A later-filed petition shall be accompanied by the employer's statement of exceptional circumstances explaining the delay.

2/ Section 10(c) of the Act, 29 U.S.C. § 659(c), provides relief "[u]pon a showing by an employer of a good faith effort to comply with the abatement requirements of a citation, and the abatement has not been completed because of factors beyond his reasonable control."

level of a proper defense which is "factors beyond [its] reasonable control" caused the delay in abatement filing. That various divisions of the corporation were uncooperative, dilatory and unwilling for whatever reason to go ahead with the abatement procedures involved does not excuse the gross neglect in seeing that the needed roof repair was carried out.

The testimony of Mr. Mays, an engineer with the Communication and Signal Repair facility amply demonstrates that from the time the citation was received in December, 1981 to as late as May, 1982 the Petitioner still did not know how the violation would be abated. (T. 33). This project was batted about from department to department with no one taking full charge, with alleged problems of departmental funding, with no evidence that there was a real effort being made to face up to repair of the violation. Interestingly enough the testimony of William M. Wehner, a registered professional engineer, who testified for the Petitioner acknowledged not only was the roof involved herein repairable but it could be done in "two - three weeks". In short the preponderance of the evidence herein absolutely demonstrates that the Petitioner was untimely filed, and that abatement of the violation herein was not brought about due to various corporate mismanagements, including neglect, failure to follow up on the problem, failure of management in its divisional control and direction, and just generally a lackadaiscal feeling in management that if left alone perhaps the problem would disappear. This conduct could hardly be called a good faith effort to comply with the abatement requirements due to factors beyond their control.

Accordingly, the petition for an extension of time for modification of abatement date to August 31, 1982, is denied.

## FINDINGS OF FACT

1. On December 15, 1981, Petitioner was issued a citation alleging violation of the standard at 29 C.F.R. § 1910.22(a)(2), and setting forth an abatement date of January 4, 1982.

2. The abatement date was subsequently extended to June 1, 1982.

3. On June 4, 1982, the Petitioner filed a petition to extend the abatement date to August 31, 1982.

4. The petition filed on June 4, 1982, was untimely under Commission Rule 34.

5. Both the untimely filing of the petition and the failure of the Petitioner to comply with the abatement requirements here due to both neglect and deficient management procedures which lead to no serious action being taken to abate the violations.

6. The Petitioner's actions demonstrated a lack of good faith effort to comply with the abatement requirements, and said abatement.

7. Abatement of the violations was within the reasonable control of the Petitioner.

## CONCLUSIONS OF LAW

1. Consolidated Rail Corporation at all times herein was an employer engaged in a business affecting commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970, and the Commission has jurisdiction of the parties and the subject matter herein, pursuant to Section 10(c) of the Act.

2. The petition herein filed for modification of abatement date was untimely filed, and Petitioner has not demonstrated good faith efforts to comply with the citation, nor has it demonstrated factors beyond its reasonable control prevented such efforts.

## ORDER

Upon the basis of the foregoing findings of fact and conclusions of law and upon the entire record, it is ORDERED that the petition for modification of abatement to August 31, 1982, is hereby denied.

JUDGE'S DECISION
SEP 20 '82
RECEIVED

FINAL ORDER ON
OCT 20 '82

APPEARANCES:

Aaron M. Smith, Esquire, Office of the Solicitor, U. S. Department of Labor, Philadelphia, Pennsylvania, on behalf of complainant.

Michael F. Swick, Esquire, Wasson, Sours & Harris, Atlanta, Georgia, on behalf of respondent.

## DECISION AND ORDER

SPARKS, Judge: During an inspection of respondent's construction site, the compliance officer saw workers nailing down decking near the unguarded edge of a floor ten feet above the ground and saw another worker walk along a block wall of about the same height while aligning an interior wall. A citation was issued charging respondent with two serious violations of the regulations which require standard railings or the equivalent in such circumstances. Penalties of $400 were proposed for each alleged violation. The conditions were corrected during the inspection.

Respondent contends that the employee standing on the wall was an isolated instance of noncompliance with a work rule which could not be foreseen constituting unpreventable employee misconduct. Respondent also asserts that guardrails were not required while workers were nailing down the deck because the work process provided that employees would be working near the edge for only a short period of time and the erection of the walls shortly thereafter would provide the equivalent of guardrails (Resp. brief pp. 5-9). Finally, respondent alleges it had no employees exposed to any hazards as the workers were employed by a related company but not by respondent.

## ISSUES

1. Whether respondent violated 29 C.F.R. § 1926.500(d)(1) in that employees were exposed to an open-sided floor or platform six feet or more above adjacent floor or ground level without a guard or standard railing or the equivalent.

2. Whether respondent violated 29 C.F.R. § 1926.500(d)(2) in that an employee was exposed on a runway four feet or more above floor or ground level without guards on all open sides.

3. Whether the employee on the open-sided runway constituted unpreventable employee misconduct.

4. Whether the workers were employees of respondent or respondent was otherwise responsible for their conduct.

5. The appropriate penalty if any.

Respondent utilizes an established procedure to erect each apartment building. The first floor wall is erected around the entire perimeter of the building.

Next manufactured truss joints are set into place. The pre-manufactured floor truss system which rises 16 inches above the wall is set in place by a crane. Thereafter, 5/8-inch plywood decking sheets are applied to the top side of the truss system which becomes flooring for the second story. The walls for the second story are built in a "lay-down" position with a shoe plate at the bottom and including windows and wood siding. The walls are then raised into position by a crane. The longest section of wall on the Huntington project was 48 feet long and 9 feet high. The walls are usually set into place after decking has been completed on one or two units (Ex. J-1; Tr. 49-54, 68-70, 77-80, 87). The walls are placed into position where the guardrails would go and necessitate the removal of the guardrail (Tr. 57, 75).

Materials are moved from the ground to the upper levels of the building by means of a Pettibone forklift. Guardrails would have to be removed to permit materials to be set down by the forklift or, otherwise, must be taken off the forklift by hand (Tr. 55, 87-89).

Mr. Wayne Woodland, respondent's job superintendent, estimated that a three-man decking crew could lay the decking for a building in one day and the entire process including decking and exterior walls could be completed in three days (Tr. 58). He also estimated it would require about a day and a half for two men to erect standard guardrails although it only took about an hour to erect a rope railing which complainant considered sufficent to abate the hazardous condition (Tr. 58, 74-75).

## 29 C.F.R. § 1926.500(d)(1)

The evidence clearly establishes that workers were engaged in work activities in proximity to the unguarded edge of a building approximately ten feet above

ground level and were thereby exposed to a fall hazard which could result in death or serious bodily injury (Ex. C-1, C-2).

In its defense, respondent points out that the conditions at its jobsite were very similar to those in H. S. Holtze Construction Co. v. Marshall, 627 F.2d 149 (1980), in which the Court of Appeals for the Eighth Circuit reversed a decision of the Review Commission and held that the failure to erect guardrails was not a violation of the Act. The guardrails would have to be removed shortly after having been built and would be replaced by exterior walls. Holtze used construction procedures similar to Schnabel, and in Holtze the court noted that (p. 152):

> . . . Holtze was eliminating the hazard itself by erecting a wall—a functional equivalent that when built would be better than a guardrail to protect against unguarded edges.

Respondent has attempted, with considerable success, to bring itself within the ambit of the rationale of the Holtze decision. However, this tribunal must apply the law as determined by the Review Commission which held that a violation had been established under 29 C.F.R. § 1926.500(d)(1).

The Review Commission (Commissioner Barnako, dissenting) treated Holtze's contentions as raising a greater hazard defense which required the respondent to prove that "(1) compliance with the standard will diminish rather than enhance employee safety, (2) alternative means of protecting the employees are unavailable, or if available, are used, and (3) a variance application under 29 U.S.C. § 655(d) is inappropriate." 1979 CCH OSHD ¶ 23,925 at page 29,007. The Review Commission determined that the affirmative defense had not been established because employees were exposed to a fall prior to the erection of the wall and did not necessarily have to be exposed while erecting a guardrail, as there was no evidence that employees could not use scaffolds or safety belts or that an application for a variance would be inappropriate.

The court of appeals did not determine that the affirmative defense of "greater hazard" had been established, but based its decision reversing the Review Commission on an interpretation of the Act that "...some modicum of reasonableness and common sense is implied."

Although there were some differences in the construction methods of Holtze and Schnabel, the conditions were so similar that application of the rationale is warranted. Judges of the Review Commission are bound by its decisions although there may be contrary decisions by circuit courts of appeals, as the Commission is responsible for establishing uniform national interpretations of the safety regulations. Mobil Oil Corp., ___ OSAHRC ___, ___ BNA OSHC ___, ___ CCH OSHD ¶ ___ (No. 77-4386, Aug. 6, 1982) at footnote 4; S & H Riggers & Erectors, Inc., 80 OSAHRC 27/A2, 8 BNA OSHC 1173, 1980 CCH OSHD ¶ 24,335 (Nos. 76-1104 and 76-1739, 1980) at footnote 9. Accordingly, respondent must prove an affirmative defense, such as "greater hazard," which it clearly failed to do. Respondent did show it would be inconvenient but not impossible to comply.

Respondent also relies upon several other decisions which support its contentions including The Palmer Company, 74 OSAHRC 43/D10, 2 BNA OSHC 3061, 1973-74 CCH OSHD ¶ 17,940 (No. 4870, 1974); Dic-Underhall, A Joint Venture, 75 OSAHRC 35/F10, 2 BNA OSHC 1651, 1974-75 CCH OSHD ¶ 19,328 (No. 2232, 1975); and Robert W. Setterlin & Sons Company, 75 OSAHRC 53/D8, 4 BNA OSHC 1214, 1976-76 CCH OSHD ¶ 20,682 (No. 7377, 1976). The Palmer Company, supra, is an unreviewed Judge's decision, issued prior to the Holtze decision of the Review Commission and therefore lacks value as precedent. Setterlin, supra, and Dic-Underhill, supra, were also decided prior to Holtze and were cited for the proposition that guardrails are not required if they would prevent work. The

evidence shows the guardrails would have to be removed prior to the erection of the walls, but guardrails would not prevent or seriously impede work activity in connection with laying the deck.

29 C.F.R. § 1926.500(d)(2)

During the walkaround inspection, a worker was observed walking along an unguarded eight-inch cinder block wall which was eight feet above the concrete floor. After he had walked to the center of the wall, he stopped and sighted along an apartment partition to determine whether it was straight (Ex. C-3; Tr. 24-26, 41).

The pertinent regulation 29 C.F.R. § 1926.500(d)(2), provides as follows:

> Runways shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f) of this section, on all open sides, 4 feet or more above floor or ground level.

A "runway" is defined in 29 C.F.R. § 1926.502(f) as a ". . . passageway for persons, elevated above the surrounding floor or ground level, such as a footwalk along shafting or a walkway between buildings." The wall was used as a "runway" in this case to enable the worker to reach a location to align the partition. A fall to the concrete floor below could result in abrasions, contusions, fractures or possible death (Tr. 26).

Respondent asserts that it established the defense of unpreventable employee misconduct, and as a result, the alleged violation should be vacated (Resp. brief p. 11). Respondent contends the affirmative defense is established by the following evidence:

> For the Respondent, Mr. Woodland testified that there is a written safety program and manual which is given to all employees including those of subcontractors (T61,62,91, R-1); that job

superintendents are allowed to establish rules in addition to those contained in the manual (T62, 91); that there is a rule regarding the use of approved ladders (T62-63); that there is a rule that walls are to be sited using approved ladders (T64,66,92); and that this rule was violated in this instance (T91, 92). There was testimony by Mr. Woodland that the safety rules were communicated to the employees by formal bi-monthly safety meetings (T65). There was further testimony as to the manner of enforcement of the safety rules by Respondent (T66). An employee who violated safety rules is given a reprimand and for a second violation is suspended for three days without pay (T66). Mr. Woodland testified that he had not observed the alleged condition before the inspection or since the inspection and that he conducted daily site inspections (T67, 71).

The facts relied upon by respondent are not contravened by probative evidence of record although complainant disputes the interpretation to be placed on the evidence (Comp. brief p. 9).

In order to establish the affirmative defense of unpreventable employee misconduct the employer may show (1) its commitment to employee safety represented by the establishment of work rules that effectively implement the requirement of the standard at issue, (2) the effective communication of the work rules to its employees, and (3) through supervision adequate to detect failures to comply with the rules and discipline sufficient to discourage such violations. Stuttgart Machine Works, Inc., 81 OSAHRC 14/A2, 9 BNA OSHC 1366, 1981 CCH OSHD ¶ 25,216 (No. 77-3021, 1981); Floyd S. Pike Electrical Contractors, Inc., 78 OSAHRC 50/E1, 6 BNA OSHC 1675, 1978 CCH OSHD ¶ 22,805 (No. 3069, 1978).

The employee who was standing on the wall did not testify so the best source of information was not questioned and the available evidence is not altogether clear and unambiguous. Mr. Woodland, respondent's job superintendent, was the principal witness to establish the defense. He explained the rule regarding aligning and straightening the walls as follows (Tr. 64, 92):

Q. Are employees instructed as to how this is to be done?

A. Yes.

Q. How was that to be done?

A. They're to use a ladder and go to the particular wall, and site it and move the ladder to the wall.

* * *

Q. Did you have a rule regarding how walls are to be sighted?

A. Yes.

Q. What is that rule?

A. They're to use an approved ladder. Like I said, take tha ladder from point to point in that building to gain access to the wall.

The rule was not written, but respondent contends the rule was orally communicated at safety meetings (Tr. 65-66). Mr. Woodland stated he had not observed the violative condition before and the offending employee was reprimanded in this instance (Tr. 66-67).

Although Mr. Woodland stated he had not observed the condition previously, there is an intimation that standing on the wall to align the partitions was a common practice. The compliance officer testified about his interview with the worker who was standing on the wall (Tr. 27, 29-30):

Q. Did you make a determination of whether this type of — this condition had occurred prior to when you cited it or when you saw it?

A. This is theonly [sic] instance I saw of this, but they [sic] guy told me that this was the easiest —

* * *

Q. . . . did you determine whether or not the condition had occurred prior to your observing it.

A. During my questioning of the employee, he informed that this was the easiest way to see if the walls were straight, there were other building on the project that were further completed than this building — particular building which he was working on.

Considering the above testimony and the fact the employee was observed during the inspection standing on the wall, I conclude the incident was not an isolated occurrence but was frequently done. The explanation that walking across the wall was the easiest way to perform the task inferred that he performed the task in that manner, especially in the context that he was performing the task in that manner at the time he was questioned. The construction project was a small one with supervisor George Mead and superintendent Woodland at the scene, so I further conclude the rule was not effectively communicated to employees nor was it adequately enforced (Tr. 71). In any event, the burden of proof is on the respondent and it has failed to establish the affirmative defense by convincing evidence.

## WAS SCHNABEL RESPONSIBLE FOR THE VIOLATIONS?

Respondent contends it did not have employees exposed to the violative conditions and therefore cannot be charged with violations under the Act. The workers were employed by Harleysville, Inc., a company with a separate legal identity but closely related to Schnabel Associates, Inc. (Tr. 46-47, 72-73). The only employee of Schnabel at the jobsite was Mr. Woodland, the job superintendent (Tr. 71). Any confusion regarding the employer is directly attributable to Mr. Woodland who identified the workers exposed to the unguarded floor as employees of the respondent (Tr. 47). Mr. Woodland testified that he had identified the workers as employees of Schnabel because "Schnabel Associates and Harleysville

are very close-tied" (Tr. 47). I conclude that, under the facts of this case, respondent was an employer of the exposed employees. In addition, as general contractor on the project, respondent could be reasonably expected to detect and abate the violations due to its supervisory authority and control over the work site. Red Lobster Inns of America, Inc., 80 OSAHRC 73/A14, 8 BNA OSHC 1762, 1980 CCH OSHD ¶ 24,635 (No. 76-4754, 1980). Respondent's job superindentent inspected the site daily and should have detected and abated the violative conditions (Tr. 71).

## PENALTIES

The Secretary proposed penalties of $400 for each violation. It is noted that few employees were exposed to the hazards, the maximum distance of a fall was little more than ten feet, the conditions were corrected during the inspection and respondent has no prior history of violations in the State of West Virginia. Under such circumstances, penalties of $200 for each violation are appropriate.

## FINDINGS OF FACT

1. Respondent, Schnabel Associates, Incorporated, has offices in Harleysville, Pennsylvania, and had gross revenues of 30 million dollars in 1981 (Tr. 4-5, 44).

2. Schnabel employs an average of 60 employees (Tr. 5).

3. Prior to the instant citation, there was no history of violations of the Act by respondent in the State of West Virginia (Tr. 5).

4. The construction site involved in this proceeding consisted of four apartment buildings each three-story wood construction with a total of 85 rentable units (Tr. 45).

5. Compliance Officer William H. Perdue conducted a general scheduled inspection of respondent's construction site on July 23, 1981 (Tr. 8-11).

6. Respondent was the general contractor at the work site (Tr. 72).

7. Workers were nailing down plywood sub-flooring on building number three at a height of ten feet, five inches, above the ground and eight feet, eight inches, above a concrete floor. There were no guardrails around the perimeter or other protection to prevent a fall (Ex. C-1, C-2; Tr. 15-17, 37, 42, 45).

8. If a person should fall from the open-sided floor onto the bracing or concrete floor below; contusions, abrasions, fractures or possible death could result (Tr. 17, 34).

9. Workers nailed down the edge of the sub-flooring and in doing so were in close proximity to the unguarded edge of the floor (Tr. 18).

10. Another employee was observed walking across an eight-inch cinder block wall. After he had walked to the center of the wall, he visually sighted down the wall to determine whether the interior walls were straight (Ex. C-3; Tr. 24, 29, 60, 64).

11. The worker on the wall over eight feet, eight inches, above a concrete floor did not have any means of protection to prevent a fall (Tr. 26, 39, 42, 60).

12. The worker indicated he spent about one hour per day sighting in the partitions by standing on the brick wall (Tr. 39).

13. It was not an isolated event for the employee to walk along an unguarded wall to align the partitions.

14. Respondent, Schnabel Associates, Inc., has very close ties with Harleysville Construction Company.

15. Respondent was an employer of employees at the work site.

16. Penalties of $200 for each violation are appropriate.

## CONCLUSIONS OF LAW

1. Respondent is an employer subject to the Act.

2. Respondent violated 29 C.F.R. § 1926.500(d)(1) and 29 C.F.R. § 1926.500(d)(2) under circumstances constituting serious violations of the Act.

3. Penalties of $200 for each violation are appropriate.

## ORDER

1. Items one and two of the serious citation are affirmed.

2. Penalties in the total amount of $400 are assessed.

Dated this 20th day of September, 1982.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

NOTICE OF DECISION

Secretary of Labor v. SHURTLEFF & ANDREWS CONSTRUCTION CO.
OSHRC Docket No. 80-4796

1. Enclosed is a copy of my decision. It will be filed with the Commission on September 21, 1982, and will become the final order of the Commission on October 21, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is October 21, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

JUDGE'S DECISION SEP 21 '82 RECEIVED

FINAL ORDER ON OCT 21 '82

APPEARANCES:

Office of the Solicitor
U. S. Department of Labor
On behalf of Complainant
By Jerry R. Atencio, Esquire
Of Denver, Colorado

Ray, Quinney & Nebeker
On behalf of Respondent
By Stephen H. Anderson, Esquire &
W. Cole Durham, Jr., Esquire
Of Salt Lake City, Utah

Vince Bosh, Pro Se
Of Helena, Montana
On behalf of the Authorized
Employee Representative

DECISION AND ORDER

Quentin P. McColgin, Administrative Law Judge:

This is a proceeding under §10(c) of the Occupational Safety and Health Act of 1970 (the Act) 29 U.S.C. §659(c), involving alleged violations of §5(a)(2) of the Act, 29 U.S.C. §654(a)(2).*/

This matter arose out of an inspection of a multi-employer work site at Colstrip Units 3 and 4 in Colstrip, Montana. On the basis of

*/ "Each employer--shall comply with the occupational safety and health standards promulgated under this [Act]."

that inspection, serious and non-serious citations (Citation Nos. 3 and 4 respectively) were issued to respondent charging it with violations of safety standards. The citations were duly contested.*/ Thereafter, a complaint and answer were filed. In its answer, respondent admits those portions of paragraphs 1 and 2 of the complaint wherein it is alleged that respondent is in a business affecting commerce and respondent is an employer within the meaning of the Act. Thus, the jurisdictional issues are admitted.

A hearing was held in this matter on March 10 and 11, 1981, in Billings, Montana. An appearance was entered at such hearing on behalf of the affected employees by Vince Bosh, Business Manager of International Union of Operating Engineers, Local No. 400 (Union). At the outset of the hearing, respondent announced that it withdrew its notice of contest as to Citation No. 4. (Tr. 6)**/ Additionally, respondent moved to amend its answer to raise certain defenses which were not raised in its answer. This motion, which was objected to, in part, by complainant, was granted.***/ (Tr. 14)

At the conclusion of the hearing, the Union made closing argument (Tr. 439-40) However, complainant and respondent waived closing argument. (Tr. 438-39) At the behest of respondent and without objection from the other parties, a sequential briefing schedule was arranged whereby

---

*/ The record reflects that only Citation No. 3 was contested. However, the complaint recites that both citations were contested, which allegation is not denied in respondent's answer. In view of respondent's subsequent withdrawal of its notice of contest as to Citation No. 4, it is of no consequence whether or not the citation was in fact contested and the order herein affirms these non-contested violations.

**/ The following abbreviations shall be used in this decision:
Tr. - Transcript page number
C - Complainant's exhibit number
R - Respondent's exhibit number

***/ Complainant's objection was limited to the assertion of the impossibility of compliance and greater hazard defenses. (Tr. 11)

complainant was allowed twenty days in which to file his brief (Tr. 450) and respondent and the Union were granted twenty days thereafter in which to file their briefs. (Tr. 451) Additionally, provision was made for the filing of a reply brief by complainant. (Tr. 451) Thereafter, briefs were filed by all parties. Attached to respondent's brief were proposed findings of fact and conclusions of law. The Union's brief consisted of a statement indicating that the Union joins in and adopts as its own respondent's brief insofar as it relates to the alleged violation of 29 C.F.R. §1926.550(a)(9). The Union took no position with respect to the other charge at issue here. Although authorized to do so, complainant did not file a reply to the post-hearing submissions by the other parties.

Having heard and observed the witnesses and having considered the testimony and other evidence together with the pleadings and arguments presented in this matter, the undersigned hereby issues the findings, conclusions and order set forth in this decision. To the extent that the proposed findings of fact and conclusions of law have not been adopted in this decision, they are rejected as being either inaccurate or unnecessary for the disposition of this case. To the extent that there are any pending motions that have not been specifically granted herein, such motions are denied.

## Discussion

### Alleged Violation of 29 C.F.R §1926.500(d)(1)

The first charge involves an alleged violation of 29 C.F.R.. §1926.500(d)(1) which provides:

> Every open-sided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing or the eqivalent, as specified in paragraph (f)(1)(i) of this section, on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder.

The specific allegation, as set forth in Citation No. 3, Item No. 1, is:

> 29 CFR 1926.500(d)(1): Open-sided floors or platforms, 6 feet or more above adjacent floor or ground level, were not guarded by a standard railing or the equivalent on all open sides:
>
> > West side stairway located on Unit No. 3 boiler was not provided with a standard railing at the 2nd, 3rd, and 4th floor platform.

The sole issue presented with respect to this allegation is the applicability of the cited standard. The evidence is clear that respondent did not provide fall protection at any of the three areas specified in the citation; that respondent's employees were exposed to the non-complying conditions and that respondent knew or should have known of such conditions.

Respondent's inapplicability contention is that the unguarded platforms which were cited were part of an integrated steel structure which was still in the process of being erected at the time of the inspection. Respondent then argues that the cited standard is inapplicable to such conditions.

The proof bears out respondent's contention. Respondent was in the process of installing gratings on the three different levels specified in the citation. (Tr. 412-13) The gratings were not bolted in and, at best, constituted a temporary flooring for portions of the specified levels. (Tr. 412-13) This evidence is corroborated by the photographs of the subject at areas which show that at each level, the grating existed in only a portion of the skeletal steel framework of the structure being erected. (C-2, C-3, C-4) Under these conditions the cited standard is inapplicable. Roanoke Iron & Bridgeworks, Inc., 5 BNA OSHC 1391, 1978 CCH OSHD ¶22,522 (No. 10,411, 1977); Car Erectors Inc., 4 BNA OSHC 2009, 1976-77 CCH OSHD ¶21,471 (No. 7247, 1977);

Pima Construction, 4 BNA OSHC 1620, 1976-77 CCH OSHD ¶20,998 (No. 5221, 1976); The Ashton Company, Inc., 3 BNA OSHC 1968, 1975-76 CCH OSHD ¶20,351 (No. 5111, 1976).

Respondent's primary concern with respect to this charge is not the applicability of the cited standard but rather the possibility of a sua sponte amendment to allege a violation of 29 C.F.R. §1926.750 (b)(1)(iii). The latter is a more specific standard applicable to employers engaged in skeletal steel construction. It provides:

> Floor periphery--safety railing. A safety railing of 1/2 inch wire rope or equal shall be installed approximately 42 inches high around the periphery of all temporary-planked or temporary metal-decked floors of tier buildings and other multi-floor structures during structural steel assembly.

Under the facts of this case, such an amendment would violate the Administrative Procedure Act. 5 U.S.C. §554(b)(3) provides in relevant part:

> Persons entitled to notice of an agency hearing shall be timely informed of . . . the matters of fact and law asserted.

Here, respondent has been informed of an asserted violation of 29 C.F.R. §1926.550(d)(1). It has never been informed of an alternative theory of violation. Moreover, as respondent correctly points out in its brief, it has never consented to any amendment of the pleadings, nor has it consented, impliedly or otherwise, to a trial of a violation of 29 C.F.R. §1926.750(b)(1)(iii).

Thus, the sole issue presented here is the applicability of the cited standard. Since that standard is found to be inapplicable, the alleged violation has not been established.

Alleged Violation of 29 C.F.R. §1926.550(a)(9)

The second charge presents, by far, the most vigorously contested and complex issues presented in this case. As set forth in Citation No. 3,

Item No. 2, it is alleged that respondent violated 29 C.F.R. §1926.550 (a)(9) by allowing its oiler within the swing radius of the rear of the rotating superstructure of respondent's crane. The specific allegation is:

> 29 CFR 1926.550(a)(9): Accessible areas within the swing radius of the rear of the rotating superstructure of crane(s) were not barricaded in such a manner as to prevent employees from being struck or crushed by the crane:
>
> > M-16 line between unit boiler 2 and 3 at an American Sky horse crane No. 11320, an oiler operator was allowed within the swing radius of the rotating superstructure of the crane exposing him to the hazard of being struck or crushed.

The standard provides:

> Accessible areas within the swing radius of the rear of the rotating superstructure of the crane, either permanently or temporarily mounted, shall be barricaded in such a manner as to prevent an employee from being struck or crushed by the crane.

While respondent has raised a number of arguments and defenses to to this charge, it is only necessary to deal with the two arguments which relate to the applicability of the standard to the facts of this case. First, respondent argues that the standard does not apply to the crane crew consisting of the crane operator and the oiler. Second, respondent argues that the standard is unconstitutionally vague as applied to such crew members. For the reasons discussed below, it is found that the standard does not apply to such crew members and that even if it does, it is unconstitutionally vague; therefore, it cannot be enforced.

The undisputed facts are that respondent installed a barricade around the circumference of the crane and permitted two of respondent's employees to work within the barricaded area. One of these employees was the crane operator, the other was an employee known as the oiler or assistant crane operator (oiler). During the inspection at respondent's work site, the oiler was observed within the barricaded area.

Before stating with more particularity the position of the parties in this matter, it is believed helpful to first define some of the terms used in the crane industry and to describe some of the physical characteristics of the equipment and to consider some of the key concepts relevant to the issues at hand and to describe the duties of the crane crew. This will be done under the subject headings listed below.

## Definitions*/

Crawler Crane. A crane consisting of a rotating superstructure with power plant, operating machinery, and boom, mounted on a base, equipped with crawler treads for travel. Its function is to hoist and swing loads at various radii.

Base (mounting). The traveling base or carrier on which the rotating superstructure is mounted such as a car, truck, crawlers, or wheel platform.

Boom (crane). A member hinged to the front of the rotating superstructure with the outer end supported by ropes leading to a gantry or "A" frame and used for supporting the hoisting tackle.

Cab. A housing which covers the rotating superstructure machinery and/or operator's station. On truck-crane trucks a separate cab covers the driver's station.

Counterweight. Weight used to supplement the weight of the machine in providing stability for lifting working loads.

Gantry (A-frame). A structural frame, extending above the superstructure, to which the boom support ropes are reeved.

Superstructure. The rotating upper frame structure of the machine and the operating machinery mounted thereon.

Swing. Rotation of the superstructure for movement of loads in a horizontal direction about the axis of rotation.

Travel. The function of the machine moving from one location to another, on a job site.

## The Crane and the Superstructure

The crane involved here is a crawler crane. (Tr. 126) It is a

Crawler, Locomotive and Truck Cranes," published by the American Society of Mechanical Engineers, USAS B30.5--1968 (hereinafter ANSI Standard). A copy of this standard is attached to complainant's brief. It is considered an authoritative source. (Tr. 250) Pursuant to the announcement made at the hearing, official notice is taken of this standard (Tr. 156)

Skyhorse 11320, which is the largest crane of this type. (Tr. 125) The crane is designed so that the crane's boom can rotate 360 degrees; however, under the manufacturer's instructions, it would not rotate more than 180 degrees with a load.*/ (Tr. 126-29)

The counterweight of this crane, which is located opposite the cab and the boom, is a trailing counterweight which is mounted on wheels. (Tr. 118-19, C-4) It rotates as the boom rotates. It, together with the wheels upon which it is mounted, is either a part of the "rotating upper frame structure of the crane or the operating machinery mounted thereon". It is, for all practical purposes, the rear of the rotating superstructure. (Tr. 118-19, C-4)

## The Barricade

As depicted in the photograph admitted into evidence as C-4, the barricade consisted of a single strand of rope approximately waist-high which was mounted on poles stuck into the ground. The barricade extended around the entire circumference of this crane approximately 34 feet from the center of the crane. (Tr. 399) The physical makeup of the barricade obviously will not prevent anyone outside the barricade from gaining access to the area inside the barricade or vice versa. Indeed, anyone could duck under it.

## Capable Swing Radius v. Rear Swing Radius

In order to differentiate between the radius in which the rear of the rotating superstructure (i.e., the trailing counterweight) can rotate and the radius in which it will actually rotate, the phrase "capable swing radius" will be used to describe the former and the phrase "rear swing

*/ Employers are required to "comply with the manufacturer's specifications and limitations applicable to the operation of any and all cranes and derricks." 29 C.F.R. $1926.550(a)(1). (Tr. 127, 129)

radius" will be used to describe the latter.*/ Since the trailing counterweight can rotate or "swing" 360 degrees. the capable swing radius in this case is also 360 degrees. However, the evidence establishes that during normal picking and swinging operations the actual rotation of the trailing counterweight of this crane will not exceed 180 degrees.**/ (Tr. 126)

There are undoubtedly times when the trailing counterweight actually swings more than 180 degrees. Thus, for example, if the crane were to hoist a load and then swing or rotate the load from Point A to Point B, where such load was deposited, and then, as its next assigned task, rotate the boom from Point B to another place (Point C) where a second load would be hoisted and then transmitted to Point D, the path of the trailing counterweight could actually exceed 180 degrees, even though neither picking and swinging operation (from Point A to Point B and from Point C to Point D) exceeded 180 degrees. There is also evidence that during assembly, the rotation of the superstructure could exceed 180 degrees.

The Hazard

The hazard which the standard is designed to prevent is that of the rear of the rotating superstructure (in this case, the trailing counterweight) striking or crushing someone while it is rotating. Being struck or crushed by the counterweight can result from essentially two situations. The first situation which is common to a variety of different types of cranes involves someone being positioned in the pinch-point of the rear of the superstructure and the track of the crane. (Tr. 61-62) Since the track would be stationary and the rear of the superstructure would rotate over

*/ Since the phrase, "capable swing radius" was not used at the hearing, it shall be used in this decision without quotations. However, the phrase "rear swing radius" has been used, and since it is not clear whether it was used in the special sense in which it is used here, that phrase will appear in quotes in this decision.
**/ In the parlance of the industry, "walking", "picking" and "swinging" mean traveling, hoisting, and rotating, respectively.

it, a scissor effect occurs. In this case, the undercarriage of the of the superstructure is 6'2", whereas the oiler was only 5'9". (Tr. 380-81) Thus, there is little risk of the oiler being crushed at the pinch-point while he is standing on the ground. However, the evidence shows that the oiler was observed on the track of the crane. (Tr. 38) Being so positioned, he is clearly in the zone of danger.

The other hazardous situation is one which is unique to cranes with a trailing counterweight. Here, the trailing counterweight is mounted on wheels. (C-4) Obviously, if someone were to be directly in the path of a rotating counterweight, such person could literally be run over by the wheels upon which the counterweight is mounted and could be struck or crushed. (Tr. 172)

## The Oiler

The oiler works with the crane operator in assembling and operating the crane. He is also called the "assistant operator" or the "oiler-operator," which more accurately describes his modern functions. The term "oiler" originated when cranes were operated by steam and required constant lubrication. Then, the crane crew consisted of three essential persons: the operator, who operated the controls; the oiler, who lubricated; and the fireman, who stoked the fire. (Tr. 299) With the advent of electric engines, the position of fireman was eliminated. Further technological advances have reduced the lubrication requirements so that now little lubrication is required while the crane is in actual operation. (Tr. 300)

Now, the oiler's primary functions during operations are safety-related. (Tr. 195) Additionally, there are certain maintenance functions he performs.*/ (Tr. 207, 215, 217, 251) His primary safety-related duties

*/ The position of oiler is also described as an apprenticeship position wherein he gains the experience and knowledge necessary to operate cranes by working with the crane operator.

are to observe the conditions that affect the crane's stability and to take appropriate corrective action if unstable conditions occur.*/ (Tr. 167, 195, 324-25)

Frequently, the appropriate action taken by the oiler is to alert the crane operator to the conditions so that the latter can correct them. Sometimes, the oiler can take direct action, such as to level the ground in the path in which the trailing counterweight is rotating (Tr. 212-13) More frequently, he alerts the operator to a condition which the latter cannot directly observe, such as the unweighting of the carriage rollers above the track which is at ground level. (Tr. 197, 201, 220, 324, 327) To a large extent, the maintenance function and the safety functions of the oiler are interrelated. Thus, he will adjust clutches and brakes during operations which could cause a load to drop if they were not adjusted properly. (Tr. 217)

The foregoing permits a more in-depth analysis of the respective positions of the parties with respect to the proper interpretation of the standard. Complainant advances the theory that the standard requires the employer to do two things: first, an employer must barricade the entire circumference around the crane in all cases where the rear of the rotating superstructure is capable of rotating 360 degrees. (Tr. 255) Second, the employer is required to keep everyone out of the barricaded area while the rear of the superstructure is rotating or is capable of rotating.**/ (Complainant's brief at 9-10)

---

*/ One of his other important safety-related duties is to keep others out of the barricaded area. (Tr. 207)

**/ As qualified, the act of the crane operator of going inside the barricade to man the controls would not constitute a failure to comply with the standard if the crane were shut down. However, by this interpretation, the crane must be shut down before the oiler goes inside the barricade in order to either relieve the operator at the controls or to receive instructions on how to operate the ocntrols. Otherwise the foregoing would constitute an instance of non-compliance with the standard.

Complainant disavows any inadequacies in the physical properties or characteristics of respondent's barricade. Respondent barricaded the entire circumference of the crane which by complainant's interpretation of the standard was required. Likewise, complainant does not take issue with the qualitative properties of respondent's barricade. This is so even though the barricade was manifestly insufficient to "prevent" anyone from entering or leaving the barricaded area. Thus, according to complainant's interpretation of the standard, a barricade which merely serves as a warning device is sufficient. (Tr. 169-70)

As expressed by the Union officials who had testified during the hearing, the Union takes the position that it is essential for the safe operation of the crane that a second person be in the immediate vicinity of the crane to observe conditions which affect its safe operation which the crane operator cannot observe himself. The Union further takes the position that to perform these safety-related duties, the oiler must be inside the barricaded area (i.e., within the capable swing radius) and, at times, within the "rear swing radius". The Union further contends that if the oiler is precluded from being inside the barricaded area, he cannot perform his safety-related duties, which will result in the abolishment of the position of oiler on crane crews. This would affect the jobs of literally thousands of oilers, as well as disrupting the current method of training crane operators. Additionally, it would, according to the Union officials, jeopardize the safety of other union members (primarily the crane operators) who would be expected to be seriously injured if the crane were to fall over.

Respondent takes the similar position to that expressed by the Union officials. Respondent also believes that it is essential for the oiler to be in the immediate vicinity of the crane (i.e., within

the barricaded area and, at times, inside the "rear swing radius"). Respondent's concern transcends that of the safety of the crane crew and their job security. In this case, respondent has other employees at the work site engaged in steel erection. These employees are also subjected to hazards associated with accidents involving cranes that have turned over or booms that have collapsed or dropped loads. First of all, a dropped load or a collapsed boom could fall on these other employees. Second, the boom or the load being hoisted can fall on the nearby structures which could cause such structures to collapse, thus, jeopardizing anyone in the vicinity of such structures.

It is possible to interpret the standard as imposing obligations different from those advanced by any of the parties. Arguably, complainant could have taken the position that the standard imposes an obligation to barricade only that portion of the swing radius in which the rear of the superstructure could be expected to rotate at any given time--the "rear swing radius". As a practical matter, the "rear swing radius" does not extend a full 360 degrees at any time other than during the assembly of the crane. More likely, the "rear swing radius" would not exceed 180 degrees. Thus, the zone of danger would not ordinarily extend a full circle around the crane. Under these circumstances, there would be no need to barricade that portion of the circumference around the crane in which the rear of the superstructure was not expected to rotate. Thus, under this possible interpretation of the requirements of the standard, some portion of the immediate vicinity of the crane would be accessible to the oiler and others which is not now accessible under the interpretation of the standard advanced here.

By not asserting this possible interpretation, the question presented is whether the promulgators of the standard drafted specifically for the

crane industry intended to limit the oiler's access to the immediate vicinity of the crane during operations, when both the employer and representative of the employees consider access to such area essential for the safe operation of the crane. It may very well be that there are good and sufficient reasons for complainant to insist upon the entire swing radius being barricaded rather than just the "rear swing radius". It may be that there are hazards in front as well as in the rear of a rotating superstructure. Alternatively, it may be impractical to guard only the "rear swing radius," particularly since such radius may vary from one pick and swing operation to the next. Moreover, in view of the possibility of the crane operator inadvertently swinging the rear of the rotating superstructure beyond the expected swing radius, it might be considered imprudent for an employer to barricade anything less than the capable swing radius. Whatever the reason, it is not suggested in this record and respondent has not had an opportunity to refute the feasibility of guarding anything less than the capable swing radius. Thus, this case shall be decided on the basis of the interpretation advanced by complainant, and any possible alternative interpretation shall not be considered.

The matters relied upon to support the interpretation of the standard advanced by the opponents of this citation begin with complainant's own interpretation of the type of barricade required under the standard. As previously stated, complainant considers adequate a barricade which does not prevent entry into the restricted area, but merely serves as a warning device to those who come near the hazardous area. The obvious beneficiaries of such apparatus are those other than the crew members who might not be aware of the hazards posed by the rear of the rotating superstructure. This coupled with the absence of any

specific requirement that an employer not permit anyone within the restricted area is entirely consistent with the interpretation of the standard advanced by the opponents of the citation that its purpose is to keep out unauthorized persons.*/

This implied exemption interpretation is also consistent with industry practice. By this interpretation, the crane operator while in the cab of the crane which is always inside the barricaded area would be in compliance with the standard. Conversely, under complainant's interpretation, the presence of the crane operator in the cab would constitute a technical non-compliance with the standard.**/ Such interpretation also would preclude the oiler from going inside the barricaded area while the crane was in operation in order to receive training from the crane operator on how to operate the crane. Additionally, it would preclude the crane operator from performing those safety-related duties and maintenance functions that, at crucial times during crane operations, must be performed while the crane is in operation.

The opponents of the citation have identified a number of specific duties which the oiler performs which must be done within the barricaded area. One of these is observing the boom for deflection during "picking

---

*/ Respondent's stated position is:
. . . [T]he most plausible reading of the barricade requirement, in light of the practical exigencies involved in the safe operation of a crane is . . .: An employer is required to construct a barricade around a crane so that no one standing outside of it can be struck or crushed by the rear of the crane's rotating superstructure. Such a barricade will have the effect of keeping unauthorized personnel away from the crane and of reminding operating personnel who must work in its proximity of the need to be particularly cautious while performing their normal work inside the swing radius. . . (Respondent's brief at 18, emphasis in original).

**/ This is not to suggest that such non-compliance would constitute the violation of the standard. The cab is always opposite the rear of the rotating superstructure. Thus, there would be no violation despite the non-compliance with the standard because the employee in the cab would not be in the zone of danger.

and swinging" operations involving loads approaching the capacity of the crane. (Tr 204-05, 243) In such instances, the oiler is required to be immediately below the boom in order to observe for deflection. To so position himself, the oiler must be within the barricaded area, although at this point, he is at the front of the rotating superstructure instead of the rear.*/ Other situations where it is essential for the oiler to be inside the barricaded area are to perform observations with respect to the crane's stability. In the case of a crawler crane, it is essential for the oiler to observe the unweighting of the rollers from the track of the crane. (Tr. 160, 162, 197-98, 239, 327) A shift as slight as 1/16 of an inch may indicate crucial unweighting which even the compliance officer conceded could not be seen outside the barricaded area. (Tr. 160, 201) In the case of other types of cranes to which this standard would also apply, there are spirit levels which the oiler must monitor during operation. (Tr. 147, 196-97, 332, 348-49) Again, such monitoring cannot be performed outside the barricaded area. Additionally, there is evidence of maintenance functions such as the adjustment of brakes and clutches which must be performed during actual "picking and swinging" operations. (Tr. 219, see also Tr. 215, 209-10, 251, 324) To accomplish such adjustments, the oiler must be within the barricaded area.

This exemption interpretation is also consistent with the interpretative guides announced by the Commission in S&H Riggers & Erectors, Inc., 7 BNA OSHC 1260, 1979 CCH OSHD ¶23,480, (No. 15,855, 1979) wherein it was announced that occupational safety and health standards "must be interpreted not only in light of existing industry

*/ If the oiler were to remain stationary while the crane continued to rotate, he would ultimately be at the rear of the rotating superstructure. Thus, this case is distinguishable from the crane operator, who is in the cab and is always in the direction opposite the rear of the rotating superstructure.

practice but also in light of the Act's expressed Congressional purpose of providing a safe and healthful workplace."

For the reasons previously stated, this exemption interpretation is consistent with industry practice and it is the interpretation advanced by complainant which is inconsistent with that practice. Further, in balancing the injuries that could be expected to occur if the oiler is permitted in the barricaded area against those that can be expected if he is precluded from such area, it is found that the latter will likely exceed the former.

In balancing these injuries, it must be recognized that the state of the art in the crane industry is such that there is a very real danger of serious injuries resulting in either case. If the oiler is foreclosed from being inside the barricaded area, wherein essential safety-related functions must be performed, there is an increased risk of catastrophic injury resulting from a collapsed boom, a dropped load, or an overturned crane. There is evidence in this record that the vast bulk of fatalities involving cranes are attributable to crane instability. (Tr. 196) Thus, the rate of fatalities could be expected to increase if the oiler were excluded from the barricaded area and could not effectively perform his essential functions.

On the other hand, if excluded from the barricaded area, the possibility of injury occurring to the oiler would be reduced substantially, but not necessarily eliminated. It is true that in such case the hazard contemplated by the standard would be eliminated; however, to the extent that the oiler's position were not eliminated, as is apprehended by the Union, he would nevertheless be subjected to the increased hazards of dropped loads, collapsed booms, and an overturned crane, since he would still be in relatively close proximity to the crane during operations. Thus, without minimizing the dangers to the

oiler posed by the presence of the rotating superstructure, it is found that on balance there is greater risk of serious injury if the oiler is not permitted in the barricaded area than if he is. For this reason, the exemption interpretation, which would exempt from the standard's coverage the crane crew consisting of the crane operator and the oiler, is believed the most reasonable of the alternative interpretations advanced here.

Even if it were found that the interpretation of the standard advanced by complainant was correct, the special circumstances shown by this record compel a holding that the standard is impermissibly vague when retroactively applied to exclude the oiler from the barricaded area. The leading case on this issue is Diebold, Inc. v. Marshall, 585 F.2d 1327 (6th Cir. 1978) (Diebold) wherein the Court found that the point of operation guarding requirement was impermissibly vague as applied to press brakes utilized by respondent there. The Court held that a combination of the following factors established the vagueness of the standard as applied to the particular type of operations involved: (1) inartful drafting of the standard, (2) the common understanding and commercial practice relative to the standard involved; and (3) confirmation of industry practice by a pattern of administrative enforcement of the regulation. Diebold, supra, 585 F.2d at 1336-37.

All three factors are present here. The inartfulness of the language of the standard is essentially a latent condition which becomes evident in the context of the special conditions present in the crane industry.*/ Indeed, without any special knowledge of crane operations,

*/ These special circumstances are an appropriate area of inquiry in construing the standard. Ryder Truck Lines v. Brennan, 597 F.2d 230 (5th Cir. 1974)

a reasonable person would likely conclude that the barricading requirement was designed to exclude everyone from the barricaded area.

With regard to the employees not involved in operating the crane, the standard is clear. A barricade must be set up to prevent such employees from wandering into areas where they might be struck or crushed by the rear of the rotating superstructure. Nevertheless, the standard is ambiguous to the extent that it does not clarify whether an employer's obligation under this standard extends beyond erecting a barricade to include either policing its perimeter to insure that no one goes inside it, or, in the alternative, imposing upon employers an obligation to establish work rules prohibiting its employees from being inside the barricaded area.

Further ambiguity inherent in the standard is demonstrated by complainant's interpretation of its requirements. Here, it is clear that the standard, as interpreted by complainant, does not mean what it says. The standard contemplates the installation of a physical barrier sufficient to "prevent" access to the restricted area. However, complainant does not so interpret and enforce its requirements. Instead, complainant considers adequate a barricade which merely warns of danger and which is only nominally a physical barrier. In light of this enforcement posture, coupled with the prevailing industry practice of permitting both the crane operator and the oiler to have access to the barricaded area, there is a genuine ambiguity as to whether the scope of the standard was intended to include the aforesaid crew members.

The second factor is present here with even greater force. The evidence is unrefuted that until shortly before the issuance of the citation sub judice it was the common understanding of the industry that the

barricading requirement did not apply to the crane crew. (Tr. 227, 307-08, 362-63, 387, 398-99, 407-08) Moreover, there is pervasive evidence that the oiler routinely works within the barricaded area. Indeed, no single duty of an oiler has been identified in this record which is routinely done outside the barricaded area.

Finally, there is evidence here of a pattern of administrative enforcement of the standard which is consistent with the industry's interpretation of the standard. The evidence on this point begins with the absence of a single reported case prior to the issuance of the citation sub judice where an employer has been cited for permitting an oiler to be within the barricaded area. Additionally, there is the testimony of respondent's owner and chief operating officer that both state and federal safety inspectors have, in the past, observed oilers within the barricaded areas of cranes at respondent's various work sites and have never previously cited respondent for such circumstance. (Tr. 398-99, 407-08) Corroborating this evidence is the testimony of Union officials and the compliance officer, none of which are aware of a single citation having been issued based upon the oiler's presence within the barricaded area, until shortly before the issuance of the citation involved here.*/ (Tr. 103-05, 227, 307-08, 362-63) Given the pervasive

*/ A citation was issued to another employer at the same work site alleging a violation of this same standard. This earlier citation was issued July 29, 1980--a week after the completion of the inspection which resulted in the issuance of the citation sub judice. This earlier citation was based upon a fatality investigation where an oiler was crushed by the pinch-point of another crane. It was ultimately affirmed in Bechtel Power Corp., Docket No. 80-4764, issued June 2, 1981.

evidence in this record that oilers routinely work within the barricaded area to perform their assigned duties, it appears that OSHA did not enforce the standard against the oiler until shortly before the inspection which resulted in the issuance of this citation.

Thus, it appears that members of the crane industry have been led to the reasonable belief that the standard did not apply to oilers. Accordingly, the standard does not contain a constitutionally sufficient warning of what complainant contends the standard requires and, therefore, cannot be enforced.

In view of the foregoing, it is found that the standard, properly construed, does not apply to the facts of this case. Moreover, the standard cannot be applied because it failed to give respondent sufficient notice of the full scope of its requirements. For these reasons the alleged violation of 29 C.F.R. §1926.550(a)(9) cannot be affirmed.

ORDER

In view of the foregoing and pursuant to Fed. R. Civ. P. 52(a) which permits the entry of judgment based upon findings of fact and conclusions of law which appear in the decision, IT IS HEREBY ORDERED that:

1. Citation No. 3, Item No. 1, is VACATED.

2. Citation No. 3, Item No. 2, is VACATED.

3. Citation No. 4, Item No. 1, is AFFIRMED, and no penalty is assessed.

4. Citation No. 4, Item No. 2, is AFFIRMED, and no penalty is assessed.

DECISION

Before CLEARY, Chairman; BARNAKO and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge James D. Burroughs is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). At issue before the judge was a citation alleging that the Respondent, J.L. Foti Construction Company, Inc., failed to comply with 29 C.F.R. § 1926.451(d)(10) in that standard guardrails and toeboards were not installed at the open sides and ends on three levels of a tubular welded frame scaffold. The Secretary of Labor ("the Secretary") further alleged in this citation that the Respondent's failure to comply with section 1926.451(d)(10) constituted a repeated violation of the Act within the meaning of section 17(a) of the Act, 29 U.S.C. § 666(a).

In his decision, Judge Burroughs concluded that the Respondent had failed to comply with section 1926.451(d)(10), expressly rejecting the Respondent's defenses to this charge, including the following (as stated by the judge):

> (1) there is no credible evidence that employees of respondent were on the scaffold;
>
> (2) equivalent protection was provided by a nylon mesh net; [and]
>
> (3) the cross bracing of the scaffold provided equivalent protection; . . . .

The judge rejected the Respondent's first contention on the basis of his evaluation of the record evidence, entering a finding that employees of the Respondent worked on the three levels of the scaffold that were alleged to be inadequately guarded. With respect to the second contention, Judge Burroughs apparently accepted the Respondent's underlying premise, that is, that a nylon mesh net would provide equivalent protection. Nevertheless, he rejected the defense on the ground that "[t]he preponderance of the evidence supports the conclusion that no nylon mesh netting was in use . . . ." The judge also rejected the third contention of the Respondent, concluding that, although "[t]he cross bracing must be viewed as a type of guardrail," it did not provide "equivalent protection" to that required under the standard. Having rejected these and other defenses to the charge, Judge Burroughs affirmed the Secretary's allegation that the Respondent failed to comply with section 1926.451(d)(10).

However, the judge vacated the Secretary's allegation that the Respondent's noncompliance with the cited standard constituted a repeated violation of the Act. He noted that the Secretary based this allegation on the fact that the Respondent had previously been issued a citation alleging noncompliance with 29 C.F.R. § 1926.451(a)(4), a standard setting forth general requirements applicable to all scaffolds. He further noted that the Commission had "not addressed the question of whether a prior violation of one standard . . . can be construed as presenting circumstances that would result in a repeat violation of another standard . . . ." After considering this issue, Judge Burroughs concluded that "a repeat violation should be determined only in those cases where the same standard has been previously violated by an employer . . . ." Applying this test, he accordingly vacated the repeated allegation in the case before us. He affirmed the citation as modified to allege a serious rather than repeated violation of the Act.

Both of the parties filed petitions for review of the judge's decision and order. The Respondent took exception to the judge's conclusion that it failed to comply with section 1926.451(d)(10) and in particular argued that the judge erred in rejecting the three contentions set forth above. The Secretary took exception to the judge's conclusion that the Respondent's noncompliance was not a repeated violation of the Act. In directing review of Judge Burroughs' decision and order, Chairman Cleary expressly granted both of these petitions for review.

Since the filing of the judge's decision in this case, the Commission has decided several other cases that presented similar issues. For example, in Dick Corp., 79 OSAHRC _____, 7 BNA OSHC 1951, 1979 CCH OSHD ¶ 24,078 (No. 16193, 1979), the Commission rejected an employer's contentions (1) that the back and ends of a scaffold were not "open" within the meaning of section 1926.451(d)(10) because of the presence of cross-bracing and scaffold bucks and (2) that these devices constituted "equivalent protection" within the meaning of the standard. The Commission's decision in that case clearly articulates the respective burdens of the Secretary in establishing his prima facie case and of the employer in establishing that it falls within the "equivalent protection" exception to the standard's requirements. Because the decision in Dick Corp. interprets the requirements of section 1926.451(d)(10), the same standard that is at issue in the case now before us, its relevance to this case is clear. Also relevant to the Respondent's contentions on review is our recent decision in Wander Iron Works, Inc., 80 OSAHRC _____, 8 BNA OSHC 1354, 1980 CCH OSHD ¶ 24,457 (No. 76-3105, 1980). In that case we rejected the employer's contention that the use of safety belts constituted compliance with a standard that requires the use of guardrails. 1/ The discussion in that case as to when an employer may substitute an alternative form of protection for that required under a standard is

---

1/ The standard at issue in Wander Iron Works, Inc., supra, and the standard at issue in the case now before us are written using virtually identical language. In essence, they establish the same requirements with respect to two different types of scaffolds.

particularly relevant to the Respondent's contention in the case now before us that employees were protected by a nylon mesh net.

In addition, the Commission has issued a decision, since the filing of Judge Burroughs' decision in the case now before us, that is dispositive of the issue raised by the Secretary on review. In Potlatch Corp., 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 1979 CCH OSHD ¶ 23,294 (No. 16183, 1979), the Commission majority adopted a test for determining whether a violation is repeated within the meaning of the Act. In pertinent part, the Commission stated the following:

> A violation is repeated under section 17(a) of the Act if, at the time of the alleged repeated violation, there was a Commission final order against the same employer for a substantially similar violation.
>
> The Secretary may establish substantial similarity in several ways . . . .
>
> In the absence of evidence that the antecedent and present violations concern noncompliance with the same standard, the Secretary must present other evidence that the violations are substantially similar in nature. In this regard, we think that evidence that the violations involve similar hazards would be relevant . . . . [T]o hold that characterization as repeated is limited to subsequent violations of the same standard could lead to patently absurd results . . . .

7 BNA OSHC at 1063, 1979 CCH OSHD at pp. 28,171-72. Thus, the judge's ruling on whether the Respondent's failure to comply with section 1926.451(d)(10) was a repeated violation of the Act must be set aside and reconsidered under current Commission precedent.

Accordingly, the case is remanded to Judge Burroughs. 2/ On remand, the

---

2/ In Potlatch Corp., supra, Commissioner Barnako set forth his test for determining whether a violation is repeated under section 17(a) of the Act. That test differs in some respects from that of the Commission majority. Although Commissioner Barnako adheres to his position in Potlatch Corp., he recognizes that the orderly administration of the Act requires that the Commission's administrative law judges follow precedent established by the Commission. Gulf & Western Food Products Co., 77 OSAHRC 72/A2, 4 BNA OSHC 1436, 1439, 1976-77 CCH OSHD ¶ 20,886 at p. 25,067 (Nos. 6804 & 6805, 1976). For this reason, he joins with his colleagues in the Commission's remand order.

judge should issue a decision and order disposing of the contentions of both parties on review. The judge should reconsider the Respondent's contentions that it provided equivalent protection in light of the Commission's decisions in Dick Corp., supra, and Wander Iron Works, Inc., supra. In addition, the judge should reconsider the Secretary's contention that the violation was repeated in light of the Commission's decisions in Potlatch Corp., supra, and in subsequent cases where the Potlatch test has been applied. 3/ Finally, the judge should reconsider his finding that employees of the Respondent were exposed to the hazard, and any other issue that in his view is within the scope of the direction for review, in light of the record, including the arguments of the parties on review.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUN 30 1980

---

3/ See, e. g., Stearns-Roger, Inc., 79 OSAHRC _____, 7 BNA OSHC 1919, 1979 CCH OSHD ¶ 24,008 (No. 76-2326, 1979); Communications, Inc., 79 OSAHRC 61/A2, 7 BNA OSHC 1598, 1979 CCH OSHD ¶ 23,759 (No. 76-1924, 1979) appeal filed, No. 79-2148 (D.C. Cir. Sept. 27, 1979); Triple "A" South, Inc., 79 OSAHRC 34/D6, 7 BNA OSHC 1352, 1979 CCH OSHD ¶ 23,555 (No. 15908, 1979). The case now before us is similar to the cited cases in that the Potlatch test is to be applied even though the case was tried prior to the issuance of the Commission's decision in Potlatch Corp., supra. In cases of this type, when the Commission concludes that the Secretary has established his prima facie case, we consider whether it is necessary to afford the employer an opportunity to present additional evidence in rebuttal to that prima facie case. See, e.g., Stearns-Roger, Inc., supra, 7 BNA OSHC at 1924 & n. 15, 1979 CCH OSHD at p. 29,159 & n. 15; Communications Inc., supra, 7 BNA OSHC at 1603 & n. 5, 1979 CCH OSHD at pp. 28,813-14 & n.5. Accordingly, the judge should follow this same procedure on remand of the instant case.

COTTINE, Commissioner, concurring in part and dissenting in part:

I concur in that portion of the lead opinion that remands this case to the judge for reconsideration of whether the violation of §1926.451(d)(10) was repeated under the criteria set forth by the Commission in Potlatch Corp., 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 1979 CCH OSHD ¶23,294 (No. 16183, 1979).[1/] However, a remand to reconsider the merits of the violation constitutes an unauthorized delegation of appellate authority, is wasteful of Commission resources, and is unjustified by any intervening change of law, need to supplement the record, absence of requisite findings or conclusions,[2/] or other reason that legally supports an order requiring the judge to retrace his steps.

---

1/ The Commission decision in Potlatch Corp., supra, issued after the judge's decision, represents an intervening change in the rule of decision previously applied by the judge. Moreover, in Potlatch and the cases following it, the Commission has definitively identified the circumstances under which a violation is properly classified as repeated. See, e.g., Communications, Inc., 79 OSAHRC 61/A2, 7 BNA OSHC 1598, 1979 CCH OSHD ¶23,759 (No. 76-1924, 1979); Triple "A" South, Inc., 79 OSAHRC 34/D6, 7 BNA OSHC 1352, 1979 CCH OSHD ¶23,555 (No. 15908, 1979). Therefore, it is appropriate for the judge to re-examine the factual record in light of this change. In addition, it may be necessary in this case to allow the parties to present additional evidence that is relevant to their respective burdens under Potlatch Corp., supra.

2/ See Texaco, Inc., OSHRC Docket No. 77-2014 (June 30, 1980).

Judge Burroughs found that the preponderance of the evidence did not establish the presence of nylon mesh netting on the exterior of the scaffold where the Respondent's employees were working. The judge concluded that the cross-bracing on the scaffold did not constitute equivalent protection under §1926.451(d)(10) because the cross-bracing was not in compliance with the guardrail height requirement of the cited standard and did not have a midrail. The judge also rejected the Respondent's contention that safety belts were being worn by employees.

The rule of decision applied by Judge Burroughs in rejecting the Respondent's argument with respect to the protection afforded by the scaffold cross-bracing is fully consistent with the Commission decision in Dick Corp., 79 OSAHRC 101/E8, 7 BNA OSHC 1951, 1979 CCH OSHD ¶24,078 (No. 16193, 1979), and needs no further examination. The judge's finding with respect to the absence of a nylon mesh net on the exterior of the scaffold obviates any need to determine whether the substitution of a net as an alternative form of protection would be permissible under Wander Iron Works, Inc., OSHRC , 8 BNA OSHC 1354, 1980 CCH OSHD ¶24,457 (No. 76-3105, 1980). Judge Burroughs' factual findings and supporting credibility determinations are fully explained and comply with the requirements set forth both by the Commission and by the Administrative Procedure Act. See P and Z Co., Inc., 77 OSAHRC 211/F5, 6 BNA OSHC 1189, 1977-78 CCH OSHD ¶22,413 (No. 76-431, 1977).

A remand to the judge under these circumstances to consider arguments raised in response to a Commission direction for review issued under 29 U.S.C. §661(i), section 12(j) of the Act,[2/] constitutes an improper delegation to the judge of review authority granted exclusively to Commission members under section 12(j). The Commission is charged with the duty of formulating national policy in adjudications involving occupational safety and health. S & H Riggers and Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1264, 1979 CCH OSHD ¶23,480 at p. 28,437 (No. 15855, 1979), appeal docketed, No. 79-2358 (5th Cir. June 7, 1979). It is comprised of individuals "who by reason of training, education, or experience are qualified to carry out the functions of the Commission under this Act." 29 U.S.C. §661(a). Congress clearly intended that the Commission members would perform these functions. Furthermore, the delegation of administrative appellate responsibility that this case represents is inconsistent with the specific review provisions of this

---

2/ Section 12(j) of the Act, 29 U.S.C. §661(i), provides:

> (j) A hearing examiner appointed by the Commission shall hear, and make a determination upon, any proceeding instituted before the Commission and any motion in connection therewith, assigned to such hearing examiner by the Chairman of the Commission, and shall make a report of any such determination which constitutes his final disposition of the proceedings. The report of the hearing examiner shall become the final order of the Commission within thirty days after such report by the hearing examiner, unless within such period any Commission member has directed that such report shall be reviewed by the Commission.

act, 29 U.S.C. §661(i), and the Administrative Procedure Act, 5 U.S.C. §557(b),[3/] which provide for agency review of the initial decisions of agency employees.

In sum, the decision of the judge on the merits of the violation does not reveal the application of a rule of decision contrary to Commission precedent, see S. J. Groves & Sons Co., 79 OSAHRC 46/C8, 7 BNA OSHC 1481, 1979 CCH OSHD ¶23,650 (No. 78-5084, 1979), nor is there any intervening change in law that requires a reassessment or supplementation of the factual record. Accordingly, the judge's finding that the Respondent failed to comply with 29 C.F.R. §1926.451(d)(10) should be reviewed and decided by the Commission without remand.

---

3/ Section 8(a) of the Administrative Procedure Act, 5 U.S.C. §557(b), provides in pertinent part:

> (b) When the agency did not preside at the reception of the evidence, the presiding employee...shall initially decide the case...When the presiding employee makes an initial decision, that decision then becomes the decision of the agency without further proceedings unless there is an appeal to, or review on motion of, the agency within time provided by rule. On appeal from or review of the initial decision, the agency has all the powers which it would have in making the initial decision except as it may limit the issue on notice or by rule.

## DECISION AND ORDER

APPEARANCES:

Mark D. Katz, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant.

Louis H. Orkin, Esquire, Beachwood, Ohio, on behalf of respondent.

## STATEMENT OF CASE

Burroughs, Judge: This proceeding was initiated pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq., 84 Stat. 1590 ("Act"). Respondent timely contested a repeated citation issued to it, pursuant to section 9(a) of the Act, on August 9, 1977. Review is also sought of the penalty proposed for the alleged violation.

Respondent is a corporation engaged in business as a masonry contractor. The repeated citation resulted from visual observations made on July 28, 1977, at the Ohio Bell Telephone Building, Cleveland, Ohio.

The citation alleges that respondent committed a repeat violation by failing to comply with the requirements of 29 C.F.R. § 1926.451(d)(10). The citation described the alleged violation as follows:

> "Standard guardrails and toeboards were not installed at all open sides and ends on tubula. welded frame scaffolds more than 10 feet above the ground or floor:
>
> Scaffold on east face of Ohio Bell Telephone Building at 1015 Huron Road, Cleveland, Ohio, from roof of 6th floor to past 13th floor; men working at tier 5, 6, and 7 seen from the street, each tier's approximately 6 feet high."

A penalty of $1,400 was proposed for the alleged violation.

A hearing was held in this matter on January 3, 1978, in Cleveland, Ohio. No additional persons desired to intervene in the proceeding.

## JURISDICTION AND ISSUES

Respondent concedes that it is engaged in a business affecting commerce within the meaning of the Act and that the Commission has jurisdiction of the parties and of the subject matter herein (Para. II, Complaint and Answer).

The following issues are presented to the Commission for determination:

1. Did respondent violate section 5(a)(2) of the Act by failing to comply with the standard published at 29 C.F.R. § 1926.451(d)(10), in that employees were working on the fifth, sixth and seventh tiers of a scaffold that contained no guardrails or equivalent protection?
2. Was the violation, if it occurred, a repeat violation within the meaning of section 17(a) of the Act?

3. What penalty, if any, should be assessed in the event a violation is determined?

## FINDINGS OF FACT

The following facts are specifically determined in resolving the issues in dispute:

1. Respondent is a corporation engaged in business as a masonry contractor (Para. I, Complaint and Answer; Tr. 99). It employed approximately 26 persons on July 28, 1977 (Tr. 34, 65).

2. On July 28, 1977, Compliance Officer John A. Hutchison conducted visual observations from the street at the Ohio Bell Telephone Building, Cleveland, Ohio[1/] (Tr. 5, 67).

3. The Ohio Bell Telephone Building is over 20 stories tall with setbacks at the sixth and thirteenth floors (Ex. 1; Tr. 5, 55). Respondent's employees were engaged in removing the facing stone of the building to do work on the steel behind the stones. Some replacement of the facing stones was also being made on the building (Tr. 14, 102).

4. Respondent was the general masonry contractor for the job (Tr. 83, 102). The job commenced in the middle of March, 1977, and ended on November 13, 1977 (Tr. 100).

5. Compliance Officer Hutchison held an opening conference with J. L. Foti, respondent's president. He did not conduct a walk-around inspection and held no closing conference (Tr. 66).

---

1/ Compliance Officer Hutchison emphasized that he made no inspection but did make certain visual observations from across the street since he was denied access to the work area (Tr. 66-67).

6. Compliance Officer Hutchison was denied access to the scaffold area by J. L. Foti until he secured a search warrant. In lieu of securing a search warrant, Hutchison proceeded to view the scaffold from the ground at a position across the street from the building (Tr. 12-13, 57, 100). He was accompanied across the street by Compliance Officer Paul Cameron, J. L. Foti and Jack Fees, a safety instructor from the Construction Employer's Association (Tr. 13, 146).

7. Hutchison also made some observations from the superintendent's location at the northern base of the scaffold when he was first escorted to that location by the building manager (Tr. 9, 66).

8. J. L. Foti offered to permit Compliance Officer Hutchison to make an informal inspection, but this offer was declined by Hutchison (Tr. 90-91).

9. A multi-tiered scaffold had been erected on the roof of the sixth floor setback of the building (Ex. 2, 3, 4; Tr. 9). The scaffold was new and lightweight (Tr. 67, 101). It was a tubular welded type and one of the best ever seen by Hutchison (Tr. 14-15).

10. The scaffolding was assembled on the outside of the building up to the sixteenth floor. It was approximately 112 feet in height (Exs. 1, P; Tr. 100-101).

11. Each side of the sections of the scaffold contained diagonal cross braces (Exs. 2, 3, 4, C, Y; Tr. 15, 67-68, 87). Many of the scaffold sections were planked and contained toeboards (Exs. 2, 3, 4; Tr. 15, 17).

12. The scaffolding was approximately five feet wide (Tr. 70). The fifth, sixth and seventh sections or tiers of the scaffold had been planked (Tr. 17).

13. Each tier of the scaffold was approximately six feet high. The scaffolding was sturdy and safely tied to the building (Tr. 14-15).

14. A nylon mesh material had been erected at the working face of the building[2/] (Tr. 16, 18, 103-104). Respondent had the net constructed specifically for the job at an approximate cost of $2,700 (Tr. 103-104).

15. Employees of respondent were working at the fifth, sixth and seventh tiers of the scaffold. The scaffold contained no guardrails on these levels (Tr. 13-14, 147).

16. Anyone falling from the scaffold would have landed on the roof which was concrete with an asphalt-type coating (Tr. 70).

17. Three or four safety belts had been shipped to the jobsite, and signs were issued instructing employees to use safety belts (Tr. 117-118).

18. Respondent has a good past safety record and has never had an employee fall off a scaffold (Tr. 125).

19. On October 20, 1975, respondent was issued a non-serious citation alleging that it violated 29 C.F.R. § 1926.451(a)(4) at the Joseph Horne store at Randall Park Mall, Cleveland, Ohio (Ex. 5; Tr. 18-19). Respondent contested the violation of 29 C.F.R. § 1926.451(a)(4) but later settled on a basis that affirmed the violation (Ex. 5).

---

2/ Hutchison believed the material to be nylon because of the droop of the material but did not get close enough to formulate a positive judgment (Tr. 16-17, 53). J. L. Foti testified that the mesh material used at the site was made of nylon (Tr. 104).

## OPINION

Complainant alleges that respondent was in violation of 29 C.F.R. § 1926.451(d)(10)[3/] on July 28, 1977, at the Ohio Bell Telephone Building, Cleveland, Ohio. A multi-tiered scaffold had been erected on a setback of the roof of the building above the sixth floor level for purposes of removing facing stone in order to do certain work on the steel behind the stone and to replace some of the facing stones.

Respondent advances several arguments as to why no violation existed on July 28, 1977. These arguments can be summarized as follows: (1) there is no credible evidence that employees of respondent were on the scaffold; (2) equivalent protection was provided by a nylon mesh net; (3) the cross bracing of the scaffold provided equivalent protection; (4) safety belts were being worn by any employees observed by Hutchison to be in an unprotected area. Respondent's arguments are permeated with the assertion that the testimony of Compliance Officer John A. Hutchison lacks credibility.

---

3/ 29 C.F.R. § 1926.451(d)(10) provides:

> "Guardrails made of lumber, not less than 2 x 4 inches (or other material providing equivalent protection), and approximately 42 inches high, with a midrail of 1 x 6 inch lumber (or other material providing equivalent protection), and toeboards, shall be installed at all open sides and ends on all scaffolds more than 10 feet above the ground or floor. Toeboards shall be a minimum of 4 inches in height. Wire mesh shall be installed in accordance with paragraph (a)(6) of this section."

When Compliance Officer Hutchison arrived at the site, he contacted the building manager to obtain permission to inspect the scaffold erected on the roof of the sixth floor setback of the building. The building manager escorted him to the superintendent's position which was at the northern base of the scaffold. The superintendent informed Hutchison that J. L. Foti, respondent's president, desired to be involved in any OSHA inspection. J. L. Foti was not at the site but was immediately called. He came to the site prior to any inspection being conducted. An opening conference was requested by Foti, and the building manager's office was utilized for this purpose (Tr. 9-10). During the opening conference, Foti requested that Compliance Officer Hutchison contact his Area Director about proceeding with the inspection. Hutchison agreed to contact the Area Director and adjourned the meeting until after lunch (Tr. 11).

During the lunch hour, Compliance Officer Hutchison discussed the inspection with his Area Director and returned to the site. Compliance Officer Paul Cameron accompanied Hutchison on his return to the site. When the two compliance officers arrived at the site, Foti called his lawyer and then advised the compliance officers that they had better get a court order (Tr. 11-12). The compliance officers then proceeded across the street to view the work site from a distance (Tr. 13). The scaffold was on the outside of the building and in public view from the street (Ex. 1). Foti accompanied the compliance officers across the street and was present while they made their observations.

Prior to entering the building on July 28, 1977, Hutchison observed the scaffold from the street. He also took four photographs, which were

introduced into evidence as exhibits one, two, three and four. These photographs were taken at 9:30 a.m., just prior to his entering the building to conduct an inspection (Tr. 6-8). Respondent infers that the photographs were taken in a surreptitious manner and from such a distance that they should be ignored in deciding the issue. The photographs were made from a public street and the Compliance Officer violated no rights of respondent by taking the photographs. See Accu-Namics, Inc. v. OSHRC, 515 F.2d 828 (5th Cir. 1975), cert. den. 425 U.S. 903 (1976).

The photographs taken by Hutchison (Exs. 2, 3, 4) depict certain persons on the scaffold. He testified that he saw employees of respondent working on the fifth, sixth and seventh tiers of the scaffold and identified the persons reflected in exhibits two and three as employees of respondent (Tr. 14). He further testified that Foti and respondent's superintendent identified the persons as employees of respondent (Tr. 14, 44). Foti denied that Hutchison asked him whose employees were on the scaffold. He testified that he could not remember making a statement that the persons observed were his employees (Tr. 134). Compliance Officer Cameron, who accompanied Hutchison and Foti across the street to observe the scaffold, testified that Foti informed them that the persons on the scaffold were employees of respondent (Tr. 146-147).

Respondent submits that there is no credible evidence to indicate that respondent's employees were on the job at the time Compliance Officer Hutchison arrived at the site. Foti testified that he could not identify the persons reflected in exhibits two, three and four as his employees (Tr. 105-106, 134). However, he did not testify that they were not his employees. He

conceded that masonry work was being done on the building on July 28, 1977, (Tr. 132), and it must be noted that respondent was the masonry contractor for the job. Respondent also disputes the finding that employees were working on the fifth, sixth and seventh tiers. However, Foti conceded that employees would have had access to the fifth, sixth and seventh tiers (Tr. 133-134). Michael Phillips, a structural engineer for the consulting engineers on the project, testified that employees of respondent were working from the scaffold on July 28, 1977, while he was at the site (Tr. 86). Phillips was at the site when Hutchison arrived (Tr. 84).

Respondent seeks to counter the testimony of Hutchison, Cameron and Phillips by Foti's testimony that Hutchison never asked Foti whether they were respondent's employees[4/] and by inferring that other persons could have been on the scaffold. Respondent failed to present any direct evidence to establish that the persons reflected in exhibits two, three and four were not its employees. It simply raised the specter that other persons could have had access to the scaffold.[5/] Since the scaffold was under respondent's

---

4/ Hutchison also testified that respondent's superintendent, George Lewis Nemeth, told him that the persons on the scaffold were employees of respondent (Tr. 44). The record contains no denial by Nemeth that the persons were not employees of respondent. It should also be noted that Nemeth was on the scene when Hutchison arrived at the site, while Foti had to be called and arrived at the site minutes later.

5/ Respondent's counsel, by cross-examination of Hutchison, raised the inference that the architect, Ohio Bell's construction superintendent, the union steward (an employee of respondent) and the representative of the international union might have had access to the scaffold (Tr. 46-47).

control and supervision, this mere inference[6/] by respondent is deemed insufficient to overcome the testimony of Hutchison, Cameron, and Phillips, and Foti's own admission that masonry work was done on July 28, 1977. Accordingly, it is concluded that the persons reflected in exhibits two, three and four were employees of respondent.

Exhibits two, three and four show no standard guardrails in place on the exterior of the scaffold, and respondent does not contend that it erected standard guardrails. Respondent submits that nylon netting was used as an equivalent protection on the exterior of the scaffold.[7/] The nylon netting is not reflected in exhibits two, three, and four, and Hutchison testified that he saw no netting in use on the exterior of the scaffold. Hutchison's testimony is supported by Michael Phillips.

Phillips testified that he saw nylon mesh netting in use at the site on July 28, 1977. According to him, the mesh was in place at all levels where he saw respondent's employees working. He was uncertain as to the exact working levels of respondent's employees[8/] (Tr. 86). However, he testified

---

6/ Since respondent presented no evidence to show the persons were not its employees, the inference is based on conjecture, surmise or a premise which is wholly uncertain.

7/ Compliance Officer Hutchison conceded that nylon mesh of a proper type that is properly installed can be a valid substitute (equivalent protection) for guardrails (Tr. 53).

8/ Phillips testified that he saw the netting being used on the eighth or ninth floors (Tr. 86). It is assumed that this refers to the floors of the building and not scaffold tier level.

that the nylon mesh he observed in use was between the building and the scaffold (Tr. 86). This is the same observation made by Hutchison. He did not recall if nylon mesh was being utilized on the exterior of the scaffold (Tr. 86).

The persons depicted in exhibits two and three are shown to be standing against or next to the cross bracing on the exterior of the scaffolding. Respondent argues that the photographs, which were taken from across the street, were snapped from such a distance that the nylon net would not be reflected. This argument is unpersuasive. A 100-millimeter lens was used to take the photographs and this would magnify the photographed area (Tr. 48-49). The persons in exhibits two and three are wearing light-colored pants that would tend to highlight a net. The photographs reflect a considerable amount of clarity, and there is no net reflected in the photographs.

Joseph L. Foti testified, in general, that a nylon mesh net was specifically constructed for the job and that it was used between the scaffold and the building at the eighth floor to catch falling materials (Tr. 104-105). He further testified, in general, that the netting was used on the exterior in every area where the men were working (Tr. 105). Several exhibits, including C and Y, introduced by respondent into evidence show some nylon mesh netting on the exterior side of the scaffold. Foti testified that the netting was at the fifth, sixth and seventh tiers of the scaffold (Tr. 115-116).

Respondent introduced a photograph as exhibit C to show how the nylon netting was used on the exterior of the building. Foti testified that

the photograph represented an area where employees were to commence work (Tr. 108, 115, 128). He testified that the photograph was either of the sixth or seventh tier (Tr. 115). However, he was at first uncertain that the photograph was taken on July 28, 1977, and there is no indication as to the time of day the photograph was taken (Tr. 108, 116). Respondent also refers to exhibit F as showing netting in place. Foti testified that the netting was reflected in the shadow, but the net is not visible to the naked eye. He later testified that he could not get the netting to come out in the photograph (Tr. 114-115).

Complainant's exhibits two, three and four show no nylon net in use on the exterior of the scaffold. Exhibits introduced into evidence by respondent show nylon netting on the exterior of the scaffold. Complainant's photographs were taken at 9:30 a.m. There is no evidence to indicate the hour of the day respondent's photographs were taken. Respondent's photographs were taken by Foti, who was not at the site at 9:30 a.m. Foti appeared at the site at around 10:30 a.m. (Tr. 45), and Hutchison immediately held an opening conference with him. They conferred until they adjourned for lunch. It seems certain that the photographs could not have been taken before the lunch hour. Francis H. Jones testified that the netting could be installed in approximately half an hour (Tr. 79). Thus, the site could easily have been altered prior to Foti arriving at the site or while he was conferring with Hutchison.

Respondent also seeks to establish that nylon netting was in use on the exterior of the scaffold through the testimony of Francis H. Jones,

Joseph A. Tomaro and George Lewis Nemeth. The testimony of Jones and Tomaro is based on their observations at dates subsequent to July 28, 1977, and is considered to be immaterial as to conditions existing at the time Hutchison was at the site.

Jones, a representative of the Bricklayer's Union, testified that he was at the jobsite on July 29, 1977 (Tr. 74), and that employees of respondent were working on the fourth or fifth tier of the scaffold on July 29, 1977. He observed nylon mesh netting being used on the outside of the scaffold at all areas where employees were working (Tr. 75-76, 79). He had no knowledge as to when the netting was installed (Tr. 77). Since Jones was not on the site on the date of inspection (July 28, 1977), his testimony has no bearing on the credibility of the witnesses. He also conceded that the person shown in exhibit three appears to be leaning against the cross braces and that no nylon mesh is shown in the photograph (Tr. 80).

Joseph A. Tomaro, a safety inspector for the Industrial Commission of the State of Ohio, testified that he inspected respondent's jobsite at the Ohio Bell Telephone Company building on August 9, 1977 (Tr. 93), and that he observed cross bracing and netting in use at the site (Tr. 94). According to him, the netting was on the exterior side of the scaffolding. He testified that, in his opinion, the netting was supported in sufficient manner to prevent an employee from falling to the ground (Tr. 94-95). His testimony is not in conflict with the testimony of Hutchison since his observations were made on August 9, 1977, and not on July 28, 1977.

George Lewis Nemeth, respondent's superintendent for the job, testified that netting was used on the exterior of the fifth, sixth and seventh

tiers of the scaffold on July 28, 1977 (Tr. 141, 143). However, he did not testify that the netting was in place at the time Hutchison arrived at the site. It is also interesting to note that Foti never mentioned netting to Hutchison when they observed the scaffold from across the street.[9/] The preponderance of the evidence supports the conclusion that no nylon mesh netting was in use on the exterior of the scaffold where employees of respondent were working.

Respondent submits that the cross bracing of the scaffold constituted equivalent protection. The cross bracing must be viewed as a type of guardrail. Section 1926.451(d)(10) requires that guardrails be approximately 42 inches high and contain a midrail of 1 x 6 inch lumber. The cross bracing has no midrail and is not at a consistent height of 42 inches. It does not constitute equivalent protection as contemplated by the standard.

Respondent also argues that any employees observed by Hutchison were probably wearing safety belts if they were in an unprotected position. This would constitute an affirmative defense and respondent would have the burden of establishing that the employees were wearing safety belts. Foti simply testified that three or four safety belts were shipped to the site and signs were issued which instructed employees to use safety belts. There is no direct testimony that the employees observed by Hutchison were wearing

---

9/ Phillips was present during the conversation and testified that Hutchison informed him and Foti that he did not see any guardrails (Tr. 84). Phillips further testified that he heard no discussions concerning the use of nylon mesh netting (Tr. 87, 91).

safety belts. Respondent simply raises the possibility that safety belts might have been worn. It failed to establish the facts showing safety belts were being worn. The violation is affirmed.

Each tier of the scaffold was six feet in height. Employees were observed on tiers five, six and seven. This means that employees were working at heights ranging from 30 to 42 feet above the roof level. It is now well settled that in determining whether a violation is serious, within the meaning of section 17(k) of the Act,[10/] the only relevant consideration is whether there would be a substantial probability of death or serious physical harm in the event an accident occurs. California Stevedore and Ballast Co., 73 OSAHRC 39/B5, 1 BNA OSHC 1305, 1973-74 CCH OSHD ¶ 16,520 (Dkt. No. 14, 1973), aff'd 517 F.2d 986 (9th Cir. 1975). A fall from heights ranging between 30 and 42 feet is considered to present a substantial probability of death or serious physical harm to an employee. The violation was serious.

Complainant contends that the serious violation was a repeat citation within the meaning of section 17(a) of the Act.[11/] This position is based on the fact that respondent was issued a non-serious citation on October 20,

---

10/ Section 17(k) of the Act states:

> "For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation."

11/ Section 17(a) of the Act provides:

1975, alleging that it violated 29 C.F.R. § 1926.451(a)(4)[12/] at the Joseph Horne store at Randall Park Mall, Cleveland, Ohio (Ex. 5). The citation was contested and later settled on a basis that affirmed the violation. The citation described the violation as follows:

> "Failed to provide standard safety railing on scaffolds more than 10 feet above adjacent ground or floor:
> Third floor level rear of building, many men working on large scaffold platform with single top rail, slanted rail or no rail at all, no material placement at time of inspection, material was placed and no railings were replaced."

Each Commission member has espoused a separate point of view concerning the elements necessary to establish a repeated violation. George Hyman Construction Company, 77 OSAHRC 67/C7, 5 BNA OSHC 1318, 1977-78 CCH OSHD ¶ 21,774 (Dkt. 13,559, 1977), appeal docketed, No. 77-1591 (4th Cir., May 2, 1977). As a consequence, the Commission has not developed a consistent criteria that is applicable to all cases. Chairman Cleary and Commissioner Barnako both share the view that two prior violations are not essential before a repeat violation can be determined and, to this extent, the

---

> "Any employer who willfully or repeatedly violates the requirements of section 5 of this Act, any standard, rule, or order promulgated pursuant to section 6 of this Act, or regulations prescribed pursuant to this Act, may be assessed a civil penalty of not more than $10,000 for each violation."

12/ Section 1926.451(a)(4) provides:

> "Guardrails and toeboards shall be installed on all open sides and ends of platforms more than 10 feet above the ground or floor, except needle beam scaffolds and floats (see paragraphs (p) and (w) of this section). Scaffolds 4 feet to 10 feet in height, having a minimum horizontal dimension in either direction of less than 45 inches, shall have standard guardrails installed on all open sides and ends of the platform."

Commission has declined to follow the decision of the Court in Bethlehem Steel Corp. v. OSAHRC, 540 F.2d 157 (3rd Cir. 1976).[13/] The fact there is only one prior violation, as in this case, is insufficient to conclude that the violation is not repeated.

Commissioner Barnako accepts the view of the Court in Bethlehem Steel, supra, that a repeated violation must consist of particularly flagrant conduct. In his view, the conduct which a repeated violation encompasses is similar to that which would raise an inference of willfulness. A distinction would be made between a willful and a repeated violation with regard to the actual intent of the employer. Proof of actual intent would not be necessary to establish a repeated violation. A repeated violation could be established by proof of objective facts from which it could be inferred that the employer's conduct had been of such a nature as to constitute a disregard of the Act's requirements. There is no evidence of flagrant conduct in this case and Commissioner Barnako's rationale would militate against finding a repeated violation.[14/]

Chairman Cleary rejects the Third Circuit's requirement in Bethlehem Steel, supra, that a repeated violation must consist of particularly flagrant

---

13/ The Court in Bethlehem Steel Corp. v. OSAHRC, 540 F.2d 156 (3rd Cir. 1976), concluded that a repeated violation must be based on at least two prior violations.

14/ Commissioner Barnako would also require evidence to show that the employer who has committed a prior violation has failed to take appropriate steps to prevent recurrences of substantially similar violations. See George Hyman Construction Company, supra. He would infer that an employer has disregarded the Act in committing a subsequent violation when that violation occurs under the responsibility of the same supervisor who was responsible for abating the original violation.

conduct. George Hyman Construction Co., supra. He would affirm a repeated violation if there was sufficient similarity between the violation at issue and an earlier violation that had become a final order of the Commission. Eliason & Knuth Drywall Co., 77 OSAHRC 161/B1, 5 BNA OSHC 1757, 1977-78 CCH OSHD ¶ 22,096 (Dkt. 14,226, 1977). A second violation of the same standard would be classified by him as a repeat violation. Williamette Iron & Steel Co., 78 OSAHRC 3/D8, 6 BNA OSHC 1304, 1977-78 CCH OSHD ¶ 22,482 (Dkt. 15,317, 1978). The employer's conduct would have no bearing on whether there was a repeat violation. The employer's flagrant conduct or flaunting of the Act would be considered in determining the amount of penalty to be assessed.

In Hyman Construction, supra, Commissioner Barnako indicated that a repeated violation would have to be a recurrence of a substantially similar prior violation. In Williamett Iron & Steel Co., supra, Chairman Cleary indicated that a violation of 29 C.F.R. § 1915.51(a) in 1975 was a repeated violation because the same standard was violated in 1972. He repudiated the argument that the two violations must be substantially identical for the second violation to be repeated and would consider the time interval between violations only for purposes of assessing a penalty. In Seattle Stevedore Co., 77 OSAHRC 189/A2, 5 BNA OSHC 2041, 1977-78 CCH OSHD ¶ 22,277 (Dkt. 9114, 1977), Chairman Clearly requires "sufficient similarity" between the violation at issue and the earlier violation in order to conclude the violation was repeated in nature.

The Commission has not addressed the question of whether a prior violation of one standard, e.g., 29 C.F.R. § 1926.451(a)(4), can be construed

as presenting circumstances that would result in a repeat violation of another standard, e.g., 29 C.F.R. § 1926.451(d)(10). This is the situation presented by the facts in this case. Sections 29 C.F.R. § 1926.451(a)(4) and 29 C.F.R. § 1926.451(d)(10) are similar in their requirements. Section 1926.451(a)(4), which was violated by respondent in 1975, sets forth general requirements for scaffolds. The standard violated in this case (29 C.F.R. § 1926.451(d)(10)) sets forth specific requirements for tubular welded frame scaffolds. Complainant submits that the prior violation of 29 C.F.R. § 1926.451(a)(4) shows that respondent had knowledge of scaffolding requirements and that this is the criteria to be used in determining if a repeat violation occurred. Respondent argues that a repeat violation should be based on a violation of the same standard.

This Judge is of the view that a repeat violation should be determined only in those cases where the same standard has been previously violated by an employer and the facts surrounding the violation are substantially similar to the previous violation. Substantially similar facts would be essential since many of the standards[15/] are nebulous in their applicability and can be construed to apply to myriad work practices. The employer should be on notice as to what is expected of him to avoid being issued a repeat citation. Accepting complainant's argument that prior knowledge of general scaffolding requirements is sufficient to sustain a repeat violation of a specific scaffolding standard would open up a Pandora's box. There are many standards that could conceivably be utilized by complainant to argue

---

15/ E.g., 29 C.F.R. § 1926.28(a) and 29 C.F.R. § 1910.132(a). Section 5(a)(1) of the Act would also fall in this category.

that a subsequent violation of a similar standard is a repeat violation.[16/] Applying complainant's logic would simply interject more uncertainty into the enforcement of the Act.

This Judge accepts the rationale of Chairman Cleary in determining whether a violation is repeat under the Act, but declines to extend his rationale to find a repeat violation of a particular standard on the basis that the employer has previously violated a similar standard. Accordingly, it is concluded that the violation of 29 C.F.R. § 1910.451(d)(10) is not a repeat violation within the meaning of section 17(a) of the Act.

The next question to be resolved is the amount of penalty to be assessed for the serious violation determined to have been committed by respondent. Under section 17(j) of the Act, the Commission is required to find and give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer and the history of previous violations in determing the assessment of an appropriate penalty.

The employees were observed at heights ranging from 30 to 42 feet above the roof level. The exterior portion of the scaffold contained cross braces. These braces provided a good measure of protection to employees. In addition, Compliance Officer Hutchison testified that the scaffold was one of the best he had ever seen (Tr. 14). A penalty of $500 is determined to be appropriate.

---

16/ Parts 1910 and 1926 of 29 C.F.R. have many subparts that set forth general standards as well as specific standards. The general requirements of some subparts might conceivably be argued to place an employer on notice for specific standards under other subparts.

## CONCLUSIONS OF LAW

1. Respondent, at all times material to this proceeding, was engaged in a business within the meaning of section 3(5) of the Act.

2. Respondent, at all times material to this proceeding, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and of the subject matter herein.

3. On July 28, 1977, respondent's employees were working on the fifth, sixth, and seventh tiers of a scaffold erected at the Ohio Bell Telephone Building, Cleveland, Ohio. The scaffold contained no guardrails or equivalent protection. Respondent was in violation of 29 C.F.R. § 1926.451(d)(10).

4. The violation was serious.

5. A penalty of $500 is assessed for the serious violation.

## ORDER

Upon the basis of the foregoing findings of fact and conclusions of law, it is

ORDERED: 1. That the repeated violation issued to respondent on August 9, 1977, is modified to affirm a serious violation of 29 C.F.R. § 1926.451(d)(10); and

2. That the proposed penalty is modified to assess a penalty of $500.

Dated this 26th day of June, 1978.

## DECISION AND ORDER

BRADY, Judge: This proceeding is brought pursuant to section 10 of the Occupational Safety and Health Act of 1970 ("Act") to contest a citation and proposed penalty issued by the Secretary of Labor ("Secretary") pursuant to section 9(a) of the Act. Respondent is charged with violating an excavation standard at a multi-employer construction site. Two dockets were consolidated for hearing which have been severed for decision.

The citation alleges a serious violation of the standard at 29 C.F.R. § 1926.651(c) which states:

> The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means.

The violation is described as follows:

> On or before 12/3/81, the employer did not adequately provide protection from falling earth in a large (127' x 129") [sic] deep (65') excavation by means of a shoring system, sloping of the ground or some other equivalent means:
>
> > The specific instance is the foundation excavation for the raw water pump house located just east of Bacon Road and just south of the shore of Lake Erie in Painesville Township, Ohio.

The issues to be resolved are whether employees were exposed to the danger of moving ground and whether Tri-State is liable for the violation in its capacity as a subcontractor.

The evidence of record, which is not in dispute, shows that respondent ("Tri-State") was a subcontractor of the construction site, and National Engineering and Contracting Company ("National Engineering") was the general contractor. Tri-State's sole function was the placement of reinforcement steel in the foundation at the base of the excavation as shown in Exhibits C-1 through C-10.

Witnesses' testimony varied as to the size of the excavation from 125' x 125' x 65' deep to 150' x 150' x 65', and the evidence also reveals that the sides of the excavation had been sloped; there were benches or terraces to catch sloughing; and monitoring devices were installed at certain points to detect ground movement. In addition, tarpaulins were placed around the top level to prevent seepage, and runoff ditches had been installed.

Testimony shows that Tri-State's employees were working in the excavation during the period of the inspection (Tr. 101-102). Also, the day before the inspection commenced, Keith Mast, a geotechnical engineer, visited the construction site. At that time he observed a "movement of earth out of the wall," which he termed a "failure surface." This failure had left a cavity 15 feet wide, 10 feet high and about

5 feet deep. Similar conditions were noted in other parts of the excavation walls (Tr. 68, 71; Ex. C-1 through C-10). He stated that "the soil was in fact not staying in place on the walls. That condition could be expected to continue due to the type of failure that was occurring . . . ." He, therefore, concluded that there was "moving ground" (Tr. 74). He noted that one failure had left a cavity 15 feet wide, 10 feet high and about 5 feet deep (Ex. C-1). In light of the amount of moving ground, and since employees in the excavation were working a few feet from the walls at such a great depth (Tr. 100-101), it must be determined that they were exposed to the "danger of moving ground." Although the evidence shows that the soil that fell remained on the terrace, there was no reason to believe more and larger failures would not occur which somehow would be contained. The Commission has held that the clear purpose of the standard is the prevention of soil movement. M. J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶ 23,330 (No. 15094). Therefore, injury or death of an employee need not occur in order to establish a violation, and it cannot be assumed that the excavation was safe merely because there had not been a more severe failure.

The Secretary having established a prima facie case, the remaining question centers on the responsibility of a subcontractor at a multi-employer construction site when there is a hazardous condition present which it neither creates nor controls.

According to the Anning-Johnson/Grossman rule, the Commission requires a subcontractor in respondent's position to show that it has protected its own employees by realistic alternative measures or that it did not have nor could it have had, with the exercise of reasonable diligence, notice that the condition was hazardous. Anning-Johnson Co., 76 OSAHRC 54/A2, 4 BNA OSHC 1193, 1975-76

CCH OSHD ¶ 20,690 at 24,784, n. 16 (No. 4409, 1976); Grossman Steel & Aluminum Corp., 76 OSAHRC 54/D9, 4 BNA OSHC 1185, 1975-76 CCH OSHD ¶ 20,691 at 24,791 (No. 12775, 1976).

Tri-State argues that the alternatives set forth in the Anning-Johnson/Grossman rule have been met, and complainant failed to establish the alternative methods in use were not effective in providing employees protection from moving ground. Also, even if a violation existed, it should not have the responsibility for its abatement in view of the assignment of liability to the general contractor.

It is not disputed that Tri-State neither created nor controlled the violative condition. Its claim, however, to have instituted "reasonable" and "realistic" alternatives must be treated as an affirmative defense with the burden of persuasion on the employer. Electric Smith, Inc., 666 F.2d 1267 (9th Cir. 1982). In this case an employee testified that respondent provided no safety instruction regarding the hazard of falling earth. Also, there is no evidence Tri-State attempted to rectify the condition or that it demanded National Engineering to abate the obvious hazard.

Based upon the large failures in the excavation walls, there was a "substantial probability that death or serious physical harm could result" to employees working in the excavation. The violation is, therefore, deemed "serious" within the definition of section 17(j) of the Act.

The next question for determination concerns the amount of penalty to be assessed for the violation. Under section 17(j) of the Act, the Commission is required to find and give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer, and the history of

previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,032 (No. 4, 1972). The Commission stated in Secretary v. National Realty and Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,188 (No. 85, 1971), that the elements to be considered in determining the gravity are: (1) the number of employees exposed to the risk of injury; (2) the duration of exposure; (3) the precautions taken against injury, if any; and (4) the degree of probability of occurrence of injury.

Weighing all the foregoing factors in light of the circumstances, it is concluded that a penalty in the amount of $100 is deemed appropriate.

## FINDINGS OF FACT

1. Tri-State Steel Construction Company, at all times hereinafter mentioned, maintained a place of business at 12608 Alameda Drive, Strongsville, Ohio.

2. On December 3 and 4, 1981, authorized representatives of the Secretary conducted inspections of a foundation excavation site east of Bacon Road and south of the Lake Erie shore in Painesville Township, Ohio.

3. Soil had fallen out of the sides of the excavation but remained on the terraces or benches. There was nothing to prevent additional soil failures falling to the base of the excavation where respondent's employees worked within a few feet of the walls.

4. Respondent's employees were exposed to danger from moving ground in the excavation walls that were not guarded by a shoring system, sloping of the ground, or other equivalent means.

5. The hazard of the wall failures could result in serious harm or death to the employees.

6. Although respondent was aware of the hazardous condition, no measures were taken to protect the employees working in the excavation.

## CONCLUSIONS OF LAW

1. Tri-State Steel Construction Company, at all times pertinent hereto, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Act and the Commission has jurisdiction of the parties and subject matter herein pursuant to section 10(c) of the Act.

2. Respondent is, and at all times pertinent hereto, required to comply with the Act and the safety and health regulations promulgated by the Secretary pursuant to section 6(a) thereof.

3. Respondent was in serious violation of the standard at 29 C.F.R. § 1926.651(c) on or before December 3, 1981.

Upon the basis of the foregoing findings of fact and conclusions of law, and the entire record, it is ORDERED:

The citation alleging serious violation of the standard at 29 C.F.R. § 1926.651(c) is affirmed, and a penalty in the amount of $100 is hereby assessed.

Dated this 27th day of September, 1982.

Larry E. Coey, Esquire, Elyria, Ohio, on behalf of respondent

## DECISION AND ORDER

BRADY, Judge: This proceeding is brought pursuant to section 10 of the Occupational Safety and Health Act of 1970 ("Act") to contest a citation and proposed penalty issued by the Secretary of Labor ("Secretary") pursuant to section 9(a) of the Act. Respondent, National Engineering and Contracting Company ("National Engineering"), the general contractor, and Tri-State Steel Construction Company ("Tri-State"), a subcontractor, were charged with violating an excavation standard at a multi-employer construction site. The two cases, consolidated for hearing, have been severed for decision.

The citation alleges a serious violation of the standard at 29 C.F.R. § 1926.651(c) which states:

> The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means.

The violation is described as follows:

> On or before 12/3/81, the employer did not adequately provide protection from falling earth in a large (127' x 129") [sic] deep (65') excavation by means of a shoring system, sloping of the ground or some other equivalent means:
>
> > The specific instance is the foundation excavation for the raw water pump house located just east of Bacon Road and just south of the shore of Lake Erie in Painesville Township, Ohio.

The issue to be resolved is whether complainant has proved the necessary elements to establish that respondent violated the standard.

The size of the excavation in question, according to witnesses' testimony, was from approximately 125' x 125' x 65' deep to 150' x 150' x 65'. The record discloses in reference to excavation work that National Engineering agreed with the project owner, Lake County, Ohio, in part as follows:

> The Contractor shall be responsible for supporting and maintaining all excavations required hereunder and even to the extent of sheeting or shoring the sides and ends of the excavations with timber or other satisfactory supports. (Ex. C-17)

In support of the allegations, complainant's evidence shows that on the day prior to the inspection Keith Mast, a geotechnical engineer, visited the construction site. At that time he observed a "movement of earth out of the wall," which he termed a "failure surface." This failure had left a cavity 15 feet wide, 10 feet high and about 5 feet deep. Similar conditions were noted in other parts of the excavation walls (Tr. 68, 71; Ex. C-1 through C-10). He stated that "the soil was in fact not staying in place on the walls. That condition could be expected to

continue due to the type of failure that was occurring . . . ." He, therefore, concluded that there was "moving ground" (Tr. 74). Mr. Vrabel, safety specialist who conducted the inspection, testified that he observed "slumping and falling earth" in the sides of the excavation which he also considered "moving ground" (Tr. 52; Ex. C-2).

Mr. Harold Powell, an inronworker for Tri-State Steel working in the excavation during the time of the inspection, testified that he saw soil fall from the excavation walls which remained on a bench or terrace approximately 8 feet wide and 40 feet above the base. At times his duties required him to work approximately four feet from the side of of the wall at the bottom of the excavation (Tr. 101-103; Ex. C-8). The record also shows that National Engineering's project superintendent was seen "in the hole," and laborers were observed working in the excavation (Tr. 37, 97-98).

It is the basic contention of complainant that sloughing and wall failures constituted moving ground which presented a hazard to employees working in the excavation and, thus, the standard was violated.

Respondent maintains that the measures of protection implemented were adequate and constituted "other equivalent means," as shoring and sloping, within the purview of the standard. Respondent's evidence shows that the sides of the excavation were sloped to some extent; benches or terraces were cut, and monitoring devices were placed at certain points to detect ground movement. In addition, tarpaulins were placed around the top to prevent seepage, and runoff ditches had been dug.

In deciding cases arising under the standard, it is important to first understand that its purpose is the prevention of soil movement. M. J. Lee

Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶ 23,330 (No. 15094). The testimony of witnesses clearly establishes that there was movement of soil in the walls of the excavation. Although the evidence shows the soil that fell remained on the terrace, there is no reason to believe more and larger failures could not occur which would be contained in that manner. In light of the amount of soil moving in the walls, it is obvious employees working at the base of the excavation near the walls were exposed to the "danger of moving ground." In addition, it is important to recognize that soil movement may occur in different forms. In M. J. Lee Construction Co., supra, the Commission stated in footnote 6 that:

> . . . the record establishes that prior to the inspection there had been soil movement in the form of erosion and sloughing in the same excavation.

Whether in the form of sloughing, the presence of which is admitted, or as partially collapsed walls, employees in this case were exposed to danger of moving ground and respondent did not provide adequate means of protection.

The fact that the soil was caught by the terraces cannot be viewed as evidence the system of protection used by respondent was adequate to protect employees working in the excavation. The arguments that the excavation dimensions, soil composition, and angle of repose were not determined are likewise rejected as necessary elements for proof of the violation. As explained by the Commission, the standard does not refer to any specific requirements for sloping or shoring; thus, the question is whether the degree of sloping, shoring, or equivalent means is adequate to protect employees working within the excavation. Seward Construction Company, Inc., 77 OSAHRC 75/C5, 5 BNA OSHC 1422, 1977 CCH OSHD ¶ 21,803 (No. 8684).

Under the circumstances of this case, the liability of respondent also extends to employees other than its own. First, National Engineering is the employer who created and controlled the hazard. Secondly, it could reasonably be expected to prevent or detect and abate the violation due to its authority and control over the work site. Red Lobster Inns of America, 80 OSAHRC 70/A2, 8 BNA OSHC 1762, 1980 CCH OSHD ¶ 24,635 (No. 79-552).

The standard was, therefore, violated as alleged and, based upon the size of the failures in the excavation walls, there was a "substantial probability that death or serious physical harm could result" to employees working in the excavation. The violation is, therefore, deemed "serious" within the definition of section 17(j) of the Act.

During the course of the hearing, complainant moved to amend the citation pursuant to Commission Rule 2(b) and Rule 15(b) of the Federal Rules of Civil Procedure to conform to the evidence. Complainant seeks to amend the citation to allege a "repeat" type violation rather than a "serious" type. The motion is based on Exhibit C-19 which reveals that a citation was issued National Engineering on August 11, 1976, alleging serious violation of the same standard which is the subject of this case. Subsequent to the filing of a notice contesting the citation, an order was entered on June 13, 1977, affirming the citation.

On the basis of the record in this case, the motion to amend the citation is granted.

In determining whether the violation is repeated, the facts must be considered in light of the Commission's clearly stated position in Potlatch Corporation, 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 1979 CCH OSHD ¶ 23,294 (No. 16183, 1979). The Commission held that a violation is repeated if, at the time of the alleged repeated violation, there was a Commission final order against the same

employer for a substantially similar violation. A showing by the Secretary that the past and present violations are for failures to comply with the same standard adequately establishes substantial similarity.

In this case, the Secretary has established the repeat violation within the scope of the Potlatch decision. The arguments advanced by respondent in its brief are not sufficient to preclude application of the Potlatch holding to the instant case.

The next question for determination concerns the amount of penalty to be assessed for the violation. Under section 17(j) of the Act, the Commission is required to find and give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer, and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,032 (No. 4, 1972). The Commission stated in Secretary v. National Realty and Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,188 (No. 85, 1971), that the elements to be considered in determining the gravity are: (1) the number of employees exposed to the risk of injury; (2) the duration of exposure; (3) the precautions taken against injury, if any; and (4) the degree of probability of occurrence of injury.

Weighing the foregoing factors in light of the circumstances, including respondent's efforts at compliance and the type of soil involved, commonality of supervisory control over the violative condition, proximity of the violations and time lapse between violations, it is concluded that a penalty in the amount of $400 is deemed appropriate.

## FINDINGS OF FACT

1. National Engineering and Contracting Company, at all times hereinafter mentioned, maintained a place of business at 12608 Alameda Drive, Strongsville, Ohio.

2. On December 3 and 4, 1981, authorized representatives of the Secretary conducted inspections of a foundation excavation site east of Bacon Road and south of the Lake Erie shore in Painesville Township, Ohio.

3. Soil had fallen out of the sides of the excavation but remained on the terraces or benches. There was nothing to prevent additional soil failures from falling to the base of the excavation where employees worked within a few feet of the walls.

4. Employees were exposed to danger from moving ground in the excavation walls that were not guarded by a shoring system, sloping of the ground, or other equivalent means.

5. The hazard of the wall failures could result in serious harm or death to the employees.

6. On August 11, 1976, respondent was issued a citation alleging serious violation of 29 C.F.R. § 1926.651(c). The citation was affirmed as a final order of the Commission on June 13, 1977.

## CONCLUSIONS OF LAW

1. National Engineering and Contracting Company, at all times pertinent hereto, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Act and the Commission has jurisdiction of the parties and subject matter herein pursuant to section 10(c) of the Act.

2. Respondent is, and at all times pertinent hereto, required to comply with the Act and the safety and health regulations promulgated by the Secretary pursuant to section 6(a) thereof.

3. Respondent was in repeat violation of the standard at 29 C.F.R. § 1926.651(c) on or before December 3, 1981.

Upon the basis of the foregoing findings of fact and conclusions of law, and the entire record, it is ORDERED:

The amended citation alleging repeat violation of the standard at 29 C.F.R. § 1926.651(c) is affirmed, and a penalty in the amount of $400 is hereby assessed.

Dated this 27th day of September, 1982.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

NOTICE OF DECISION

Secretary of Labor v. RAMCO WELL SERVICE, INC.
OSHRC Docket No. 82-0243

1. Enclosed is a copy of my decision. It will be filed with the Commission on September 27, 1982, and will become the final order of the Commission on October 27, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is October 27, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

DECISION AND ORDER

Child, R. M., Judge, OSHRC:

Statement of the Case

This matter is before the Occupational Safety and Health Review Commission (the Commission) pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et seq., (the Act). Complainant seeks affirmance of item 1 of Citation No. 1, issued to respondent February 4, 1982, charging a serious violation of section 5(a)(1) of the Act[1/] and of a penalty proposed in the sum of $750.00.

1. The alleged violation and section 5(a)(1) of the Act:

Citation as amended (Tr. 9)

"1. Section 5(a)(1) of the Occupational Safety and Health Act of 1970: The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to employees, in that:

An employee was not provided with protection from falls ranging from ten to approximately seventy-five fee[t] while ascending to and descending from the rod basket of the Cooper

The Citation resulted from an inspection of respondent's work site near Ames, Oklahoma on January 19 and 20, 1982. Notice of Contest, Complaint, and Answer were filed in due course. Respondent in its pleadings admits jurisdiction in the Commission of the persons and the subject matter of these proceedings and alleges as an affirmative defense that if a violation occurred it was the result of unpreventable employee misconduct.

Hearing was held at Oklahoma City, Oklahoma, on June 22, 1982. Notice of the hearing was duly published by the respondent and, except as they may have been called as witnesses, there was no appearance by or on behalf of affected employees.

At the conclusion of the hearing both parties waived closing argument and announced intention to file briefs in support of their positions. Only the complainant has done so.

Issues:

The issues to be determined are:

1. Was the respondent in violation of section 5(a)(1) of the Act, commonly known as the general duty clause.

2. If a violation of the Act occurred, as alleged, was it the result of unpreventable employee misconduct.

---

1. (Contd.)

well servicing unit, Serial No. .093, company rig number nine on January 12, 1982. Acceptable methods of abatement would include the employer's providing and insuring of the use of a safety belt with appropriate lanyard while the employee rode the traveling block or the providing and insuring of the use of an appropriate safety climbing device or climbing assist while the employee utilized the derrick climbing ladder."

The Act

"Section 5(a)(1): (29 U.S.C. 654(a)(1)) Each employer--shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees:"

3. What, if any, penalty would be appropriate.

The Evidence

Hugh Terrel - Compliance officer for complainant, testified that as a result of a reported fatality which occurred on January 12, 1982, he was assigned to inspect a work site of respondent. Respondent services oil wells, and although the rig where the fatality occurred had been moved prior to his investigation, he went with respondent's vice-president, Bob Pitchford, to view and photograph a similar unit to that whereon the fatality occurred, and which was rigged up at the time of the investigation. (Tr. 14-16) Mr. Pitchford told him that the company had "increased" its safety program approximately two and one-half months prior to the accident when an insurance representative began inspecting the various rigs for safety hazards and giving safety talks to the employees. (Tr. 16)

An oil well servicing unit is a truck mounted derrick assembly which can be raised over an existing oil well which requires servicing in order to maintain or renew its production. (Tr. 19) Cables raise and lower a traveling block from which are suspended rigid members known as "bales" which in turn are fastened to a fitting known as the "elevator". (Tr. 23) In pulling pipe from the well, the elevator is fastened to the upper aspect of the well pipe at or near ground level and is then elevated to the tubing board which is a platform on the derrick approximately fifty-five feet above ground level. It is necessary for a member of the rig crew to work on the tubing board during the operation of removing or replacing the well pipe. Mr. Terrell determined that the fatality occurred when the man assigned to work on the tubing board was being raised to that height by standing on the elevator with his arms through

the openings in the upper part of the bales. As he reached the tubing board, he fell off the elevator to the ground. (Tr. 23-24)

Mr. Terrel stated his opinion to be that riding the elevator to or from the tubing board presented a hazard of falling approximately 55 feet to the ground. (Tr. 24) In his opinion the hazard could be abated by ascending to or descending from the tubing board via the derrick ladder utilizing a "climbing assist", or riding the elevator, but while doing so utilizing a safety belt tied off so that a fall could be no more than five feet. (Tr. 30)

Investigation disclosed that the fatally injured worker was not wearing a safety belt at the time he fell from the elevator. (Tr. 30)

The American Petroleum Institute document No. RP-54 provides for riding of the blocks with safety line attached so as to prevent a fall of more than five feet. (Tr. 43; Exhibit C-4) The Occupational Safety and Health Administration in Region VI views compliance with the American Petroleum Institute's published document RP-54 by riding the blocks while wearing a safety belt with a lanyard tied off to prevent a fall of more than five feet as not presenting a hazard recognized by the petroleum producing industry. (Tr. 45; Exhibit C-5)

Bob Pitchford, Vice-President of respondent, was called as a witness by the complainant. He is in charge of operations for respondent and as such he would hire each rig operator, who in turn may be allowed to hire his own men. (Tr. 54-55) In the course of 30 years in the oil field business he has heard of men falling while riding the blocks up and down. (Tr. 55) He first heard of this about 1951 in Odessa, Texas. (Tr. 56)

He is familiar with the American Petroleum Institute and partially familiar with its recommended standards and practices, including RP-54. He is only familiar with RP-54 through safety meetings, safety engineers, and insurance men. (Tr. 55-56) Respondent prefers the men not to ride the elevator, but if they ride they are supposed to have a safety belt and a cable attached to the bales. The employees know this through their supervision--in this case, that would be the rig operator. (Tr. 46-57) Prior to the fatal accident which gave rise to the investigation and citation in question, Mr. Pitchford had never heard of any employee of the respondent being terminated for failure to wear tied-off safety belts while riding the elevator block. (Tr. 58) Although the operator is not considered management, he bosses the other three men on the rig and is in charge from the time he takes the men out until he brings them back in. (Tr. 58-59) Safety rules are verbal instructions pretty well known around the dog houses, at safety meetings, in the waiting room and at tailgate meetings. Whoever is in charge talks about safety and instructs the men on any particular hazard on a certain job. (Tr. 59, 60) About one month prior to this fatal accident, respondent's insurance carrier held a meeting at respondent's place of business. The carrier instructed that it was acceptable to ride the traveling blocks with a safety line attached. This was communicated to the toolpushers, who were in turn to communicate it to the employees. He didn't know whether these instructions were being obeyed. (Tr. 60-61) Approximately 94 percent of the employees attended the meeting where the insurance representative advised it was legal to ride the block as long as they wore safety belts attached to the bales. (Tr. 62-63) At the time of the

accident there was a safety belt on the tubing board, 55 feet above the ground. The injured employee had left it up there when he descended possibly one hour earlier. (Tr. 63-64)

Albert Dean Copeland, called by the complainant, testified that he was the operator on the rig where the fatality occurred and that as such he was the crew chief and operated the controls. (Tr. 66-68) He operated the controls which took the worker up to the tubing board. The fall occurred as the man was stepping off due to slipping as a result of oil and paraffin on the elevator and slick wet gloves. (Tr. 69) The deceased had ridden up on the elevator previously on that date. He had worn the safety belt while riding the elevator several times, but it wasn't tied off. (Tr. 71) On the day of the accident, the wind was blowing but the weather was clear. They were in a hurry to get the job done. (Tr. 72) As operator, he is in charge of the rig while they are in the field. (Tr. 72) The employee who was killed was about 21 years old and had worked about three months. Mr. Copeland attended the meeting where the insurance representative spoke. Although he did not know, he nonetheless believed that the employee who was later killed was not at that meeting. (Tr. 73) The respondent did supply a safety belt for the rig, and he as operator was told to use it, and to see that the employee riding the blocks tied off. (Tr. 74-75) He was discharged by the respondent in March of 1982. (Tr. 75) The reason for discharge does not appear in the record.

Leonard Juliano - called by the complainant as a witness, testified that he was employed as a floor hand on the rig when and where the fatal fall occurred on January 12, 1982. It was cold with a slight breeze. (Tr. 77-78) There was a safety belt on the rig and they had all been

instructed to wear it when riding the blocks. (Tr. 80) There were occasions when he has seen men ride the elevator while not wearing the safety belt. (Tr. 80)

Hugh Terrel - called as an adverse witness by the respondent, explained that the block and elevator ascend through a hole in the bottom of the tubing board. (Tr. 86) Although it does not so appear from Exhibit C-3 which shows an atypical elevator, ordinarily the upper surface of the elevator is sufficiently flat and wide to accommodate both feet of the person riding. (Tr. 88)

## Discussion

Section 5(a)(1) of the Act requires employers to provide their employees workplaces ". . . free from recognized hazards that are causing or are likely to cause death or serious physical harm." To establish a violation of what is referred to as this general duty clause of the Act, the complainant has the burden of showing (1) that the respondent failed to keep the workplace free from a hazard (2) which was recognized (3) the likely consequence in the event of an incident was death or serious physical harm, and (4) there were feasible means available to abate the hazard. National Realty and Construction Company v. OSHRC, 489 F.2d 1257, (1973); Sec. of Labor v. United States Steel Corporation, OSHRC Docket No. 77-1796 (1982).

Here an employee was permitted in the presence of his operator, who was the foreman and direct representative of the respondent at this work site, and with the participation of the operator, to ride the traveling blocks of this oil service rig to a height of 55 feet while standing on a surface which had oil and paraffin on it wearing wet and slippery gloves and without the benefit of a safety belt tied off to prevent a fall.

The hazard of falling is evident to even a casual observer. A hazard is said to be recognized when it is known to the employer or when it is known by the industry in general. Respondent's vice-president testified that he was aware of workers falling from traveling blocks and had been aware of this in the course of some 30 years in the oil field business commencing with an incident in about 1951. (Tr. 17, 55, 56) Thus, the respondent is charged with knowledge of the hazard. It was further demonstrated that the industry has knowledge of the hazard since the American Petroleum Institute's publication, "Recommended Practices for Occupational Safety and Health for Oil and Gas Well Drilling and Servicing Operations," (RP-54) specifically treats the hazard and how to avoid it. (Exhibit C-4; Tr. 43)

That death or serious physical harm would be the likely result if a fall were to occur from the traveling blocks, which lift a man as high as 55 feet, was testified to by the compliance officer and stands unrefuted.

Finally, the evidence shows that there were two available means of abating the hazard. First, the respondent could have enforced its work rule that if employees ride the blocks they do so only while wearing a safety belt tied off to prevent a fall of more than five feet. Second, the employer could have required the worker to ascend the derrick by means of the ladder attached thereto with the aid of the climbing assist shown in Exhibit C-3.

Respondent raises the defense of unpreventable employee misconduct. The Tenth Circuit Court of Appeals has held that in a case where the presence or absence of a violation essentially turns on alleged omissions by a supervisor, the burden of disproving unpreventable employee misconduct rests with the Secretary of Labor. It has further held that the Secretary

can meet this burden by showing that the violation was foreseeable because of inadequacies in safety precautions, training of employees or supervision. Mountain States Telephone & Telegraph Co. v. OSHRC, 623 F.2d 155 (10th Cir. 1980); Capital Electric Line Builders of Kansas, Inc. v. Secretary of Labor, Tenth Cir. No. 80-1711, 678 F.2d 128 (10th Cir. 1982). Here, although the supervisory employee was a party to the violation by permitting it to occur, the presence or absence of the violation does not essentially turn on his conduct. Even if it did, the Secretary has proven by a preponderance of the evidence that a fall from the traveling blocks on one of these rigs was foreseeable because safety precautions were inadequate, neither employees nor their supervisors were properly trained or disciplined in safety, and there was no supervision or enforcement of the verbal safety rule.

Here the evidence shows that the respondent did provide a safety belt with lanyard. However, the evidence shows a laxity in its safety program and procedures. At most there was a "verbal" rule that employees riding the blocks wear a safety belt tied off to prevent a fall. There was evidence that employees frequently rode the traveling blocks while not wearing safety belts (Tr. 80) and even though they may have worn safety belts with lanyards, they frequently did not bother to tie off to prevent a fall. (Tr. 71) All of this was done with the acquiescence of the operator and up until the time of the accident giving rise to the investigation and citation herein, no employee had ever been terminated for non-observance of the "work rule." (Tr. 58)

The Commission, however, places the burden of proving the defense of unpreventable employee misconduct upon the respondent who urges that

defense.[2/] To meet this burden, the Commission has required the respondent to show it had a well established work rule prohibiting the conduct, that the rule was communicated to its employees and that the rule was effectively enforced. Secretary of Labor v. Daniel Construction Company. OSHRC Docket No. 16265 (1982), 10 BNA OSHC 1549; Daniel International Corp., Wansley Project, 81 OSAHRC 71/D6, 9 BNA OSHC 2027, 1981 CCH OSHD ¶25,813 (No. 76-0181, 1981) The Commission has held that a supervisor's knowledge of the violation is imputable to the employer for the purpose of proving employer knowledge of the violation unless the employer establishes that it took all necessary precautions to prevent the violation, including adequate instruction and supervision of its supervisor. See H. H. Hall Construction Co., 81 OSAHRC 91/D12, 10 BNA OSHC 1042, 1981 CCH OSHD ¶25,712 (No. 76-4765). Where a supervisor is involved in the misconduct, this is strong evidence that the employer's safety program was lax. See Daniel International Corp., Wansley Project, supra, at 2031. Where a supervisory employee is involved in the violation, the proof of unpreventable employee misconduct is more rigorous and the defense is more difficult to establish, since it is the supervisor's duty to protect the safety of employees under his supervision. See Floyd S. Pike Electrical Contractor, Inc., 78 OSAHRC 50/E1, 6 BNA OSHC 1675, 1978 CCH OSHD ¶22,805 (No. 3069, 1978).

The evidence is that respondent had "verbal" work rules which were "pretty well known" around the doghouses, in the waiting room, at safety meetings, and at tailgate meetings. Whoever is in charge talks about safety and instructs the men on any particular hazard on a specific job. (Tr. 59-60) Respondent prefers the men not to ride the elevator,

2. The Commission position regarding the burden of proof where the defense of unpreventable employee misconduct has been raised is followed by a majority of the Circuits which have considered this issue. See Daniel International Corporation v. Secretary of Labor, _____ F.2d _____ (Eleventh Circuit, August 19, 1982) and cases there cited.

but if they ride they are supposed to have a safety belt and a cable attached to the bales. The rig operator is supposed to convey this information to workers under him. (Tr. 56-57)

This chain method of passing on a "verbal" work rule was at best haphazard. Nowhere does it appear that an attempt was made to supervise the operators or to determine if they were informing their workers or enforcing the verbal work rules. It is significant that there was no evidence of follow-up or discipline on the part of the respondent to enforce its work rule. Likewise it is significant that the evidence was that not one employee had been terminated prior to the accident giving rise to the citation herein for violation of a work rule. Clearly the evidence is that the violation of riding traveling blocks without wearing a safety belt tied off to prevent a fall of more than five feet was foreseeable and was not the result of unpreventable employee misconduct.

The record is lacking in evidence upon which a penalty can be properly computed as contemplated at Section 17(j) of the Act. A penalty of $750.00 was proposed by the complainant in the citation. At paragraph 5 of the complaint it is alleged that the proposed penalty was arrived at after giving due consideration to the gravity of the violation, the good faith of the respondent, the size of the respondent's business and the history of previous violations, as required by section 17(j) of the Act. However, in its answer, respondent denied said allegations.

That the violation was serious cannot be gainsaid. Only one employee could be exposed to the hazard at any one time on any rig, but death could ensue. We are not informed as to how many such rigs the respondent

had in operation, but from the testimony of Mr. Pitchford it appears that there were at least two. Since we are not informed as to the size of the respondent or its history of previous violations, if any, these factors must be presumed to mitigate in its favor.

On balance and considering the record as a whole, an appropriate penalty would be the sum of $500.00.

---

Having considered the pleadings, the testimony of the witnesses and the exhibits received in evidence--and having observed the demeanor of the witnesses and weighed the credibility thereof--and having considered the post-hearing memorandum, there are hereby entered the following:

Findings of Fact

1. Respondent was at all times pertinent an employer engaged in a business affecting commerce.

2. Employees riding the traveling blocks up or down while standing on the elevator suspended therefrom were exposed to the hazard of falling from the elevator to the ground level unless they wore safety belts tied off by lanyards to prevent falling.

3. Respondent furnished a safety belt and lanyard to the crew working on the well service derrick.

4. Respondent had an unwritten work rule that it preferred employees to ascend and to descend from the tubing board, which was approximately 55 feet above ground level, by means of the derrick ladder with climbing assist. However, if the men ride the elevator, they should wear safety belts with cable attached to the bales.

5. Said work rule was communicated to supervisors or operators who were in turn told to inform the workers of the work rule and to enforce it.

6. Respondent knew of the hazard of riding the blocks without a safety belt tied off.

7. The petroleum drilling and well servicing industry recognized the hazard of riding the blocks without a safety belt properly tied off.

8. A fall from the traveling blocks could be as great as 55 feet, and the likely result would be death or serious physical harm.

9. The operator on the rig in question permitted employees to ride the blocks either while not wearing a safety belt or if wearing same without requiring that it be tied off to prevent a fall. His knowledge is imputed to the respondent.

10. Because of laxity in respondent's unwritten safety program and its failure to supervise its operators in their responsibilities of communicating and enforcing the work rule in question, it was foreseeable that an employee would ride the traveling blocks without the benefit of a tied off safety belt.

11. Respondent's work rule was not well established, but amounted to permission to do a hazardous activity if it was done with caution, i.e., wear a safety belt tied off to prevent a fall.

12. Respondent did not communicate its work rule effectively.

13. Respondent did not enforce its work rule effectively.

14. An appropriate penalty to be assessed in this matter is the sum of $500.00.

## Conclusions of Law

1. The Commission has jurisdiction of the parties and of the subject matter herein.

2. The respondent was in violation of section 5(a)(1) of the Act, commonly known as the general duty clause.

3. The violation was foreseeable and was not the result of unpreventable employee misconduct.

4. Item 1 of Citation No. 1, issued to respondent February 4, 1982, should be affirmed and a penalty of $500.00 should be assessed.

**ORDER**

Item 1 of Citation No. 1, issued to respondent February 4, 1982, is AFFIRMED and a penalty of $500.00 is ASSESSED.

## NOTICE OF DECISION

SECRETARY v. ACKERMANN ENTERPRISES, INC.

OSHRC Docket No. 80-4971

1. Enclosed is a copy of my decision. It will be filed with the Commission on September 28, 1982, and will become the final order of the Commission on October 28, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupationsl Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is October 28, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

APPEARANCES:

F. Benjamin Riek, III, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant.

William F. Ultsch, Esquire, Apking and Ultsch, Cincinnati, Ohio, on behalf of respondent.

## DECISION AND ORDER ON REMAND

SPARKS, Judge: By its decision of May 25, 1982, the Review Commission remanded the captioned case for a determination of whether respondent had violated section 5(a)(1) of the Occupational Safety and Health Act of 1970 ("the Act"). The issue was originally briefed by the parties and a supplemental brief has been received from the complainant.

The citation alleged that three employees were riding in the front bucket of a "front end loader and backhoe attachment" at respondent's jobsite. It is further alleged that the employees were exposed to possible falls, or being thrown from the tractor while it was in motion.

I

The factual allegations are established in the record. On June 11, 1980, Compliance Officer Robin Medlock travelled to respondent's work site on Bells Lake Drive, Clermont County, Ohio, where four apartment buildings were under construction (Tr. 15, 117, 118). While waiting in the parking lot for a management representative, Compliance Officer Medlock saw three employees riding in the bucket as the tractor travelled from Building 4500 to Building 4700 (Tr. 22, 107-108, 160). The buildings are next to each other, separated by a few feet. There were no passenger seats in the front bucket and employees were riding in "crouched" positions with their feet placed against the outer lip of the bucket and their hands positioned against the back of the bucket (Tr. 22, 58). Medlock saw employees riding in the bucket eight to ten times during the one hour or more he was in the parking lot (Tr. 21-23).

Photographs were taken by Mr. Medlock, but they could not be located at the time of the hearing (Tr. 35). During a later visit to the jobsite, Mr. Medlock interviewed an employee who recalled that photographs had been taken of him and others who were riding in the bucket of the front-end loader (Tr. 41-41, 46-48).

Employees riding in the bucket were subject to the hazard of being thrown from or falling out of the bucket, especially if the tractor encountered rocks or chuckholes (Tr. 55, 57). There was no equipment to safeguard persons riding in the bucket and their positions were unstable (Tr. 62-63, 95-97, 130).

Respondent conceded it was extremely unsafe to ride in the bucket of a front-end loader and it is a recognized hazard to ride in the bucket (Ex. G-2, G-2, G-3, G-4, G-10; Tr. 65-67, 70-71).

Mr. Westerkamp, respondent's field superintendent, agreed that employees probably would not have been riding in the bucket if he had been present at the work site (Tr. 64, 72, 124, 129, 164). It was not unusual for Mr. Westerkamp to be away from the jobsite (Tr. 156).

Mr. Westerkamp stated there was a verbal rule against riding in the bucket of a loader, but acknowledged that the operator of the loader was Dan Criscillis who is lead carpenter and had been left in charge (Tr. 125-127, 129-130, 157, 161-162).

The condition could be abated by requiring employees to walk about the jobsite. Rules implementing and enforcing such policy were necessary (Tr. 74).

II

Section 5(a)(1) of the Act requires:

> Each employer—
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

In Bomac Drilling, Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶ 25,363 at p. 31,547 (No. 76-450, 1981), the Review Commission stated the elements of proof of a section 5(a)(1) violation as follows:

> In order to establish a section 5(a)(1) violation, the Secretary must show that an employer failed to render its workplace free from a hazard that is recognized, the occurrence of an incident was reasonably foreseeable, and the likely consequence in the event of an incident was death or serious physical harm to its employees. . . . The Secretary must also demonstrate that there were feasible means available to abate the hazard. . . . (citations omitted).

But the requirement that the occurrence of an incident be reasonably foreseeable was specifically overruled in United States Steel, ___ OSAHRC ___, 10 BNA OSHC 1752, 1757, ___ CCH OSHD ¶ ___ (No. 77-1796, June 30, 1982).

The hazard in this case is the danger of injury to workers by falling or being thrown from the bucket. Respondent recognizes the hazard and the manufacturer cautions against persons riding in the buckets or in other unapproved methods. A fall from the bucket would likely result in death or serious injury.

It was entirely feasible for employees to walk the short distances between the buildings thereby abating the hazard.

Respondent suggests the actions were contrary to its safety rules, but the evidence shows the rules were not adequately promulgated nor effectively enforced. Mr. Westerkamp testified the condition would not have occurred if he had been at the work site, but the designated person in charge was operating the tractor with the bucket in which the employees were riding.

The record establishes a violation of section 5(a)(1), the general duty clause.

A penalty of $480 was proposed by the Secretary. Three employees were exposed to the hazard. There was no indication the hazardous practice occurred each day, but the danger was great that serious injury would result in case of an accident (Tr. 76-80). In mitigation, the company promised to end the practice immediately. Respondent is considered small in size as it has fewer than 100 employees. No reduction of penalty was suggested because of the respondent's history of compliance as previous citations for violations had been issued (Tr. 76-81).

Section 17(b) of the Act requires the Review Commission to assess a penalty of up to $1,000 of each serious violation of the Act. Section 17(j) requires the Commission to consider the gravity of the violation, size, good faith and history of previous violations in determining the appropriate penalty. The evidence establishes that, in determining the proposed penalty, the Secretary considered the required elements. It is reasonable and appropriate.

## FINDINGS OF FACT

1. Respondent is an employer subject to the Act.

2. While waiting in respondent's parking lot, Compliance Officer Medlock observed three employees riding in the bucket attached to a backhoe tractor.

3. Riding in the bucket of a tractor is hazardous and is recognized as hazardous by respondent and in the industry.

4. A fall from the bucket of the tractor would likely result in death or serious bodily injury.

5. Respondent did not render its workplace free of a recognized hazard.

6. The condition could be abated by requiring employees to walk the short distances around the jobsite.

7. A penalty of $480 is reasonable and warranted.

## CONCLUSIONS OF LAW

1. The Review Commission has jurisdiction over the parties and the subject matter.

2. Respondent violated section 5(a)(1), the general duty clause.

3. A penalty of $480 is appropriate.

## ORDER

1. The citation for serious violation of section 5(a)(1) is affirmed.

2. A penalty of $480 is assessed.

Dated this 28th day of September, 1982.

| Respondent. | : | |

## DECISION

These are simplified proceedings conducted pursuant to Subpart M of the Rules of Procedure of the Occupational Safety and Health Review Commission. A conference/hearing was held December 3, 1981. During the conference portion of proceedings, the issues were narrowed to a single question: Was the alleged violation properly classified as a serious violation? Evidence was presented relating to this issue, and written arguments were thereafter filed, the last on February 8, 1982.

The Secretary of Labor was represented by attorney Cyrus Alexander of the Office of the Solicitor, Department of Labor, Chicago, Illinois. Midwest Steel Erection Company (Midwest) was represented at the conference/hearing by its Safety Director, L. Patrick Galway, and in written argument by attorney's Carey, Filter, White and Boland, Chicago.

## FACTS

The stipulation of the parties and the evidence presented at the hearing indicate the facts to be as follows:

On July 14, 1981, an OSHA compliance officer conducted an inspection at one of Midwest's construction sites in Lansing, Illinois, where a one-story building was being constructed. (T 45). The OSHA inspector observed two Midwest steelworkers connecting a horizontal steel beam to the top of a vertical "I" shaped column. The height of the column was 14 feet. (T 13). Upon inquiry he learned that the workers had reached the 14 foot elevation by "shinnying" up the vertical steel column. (T 13). Shinnying is a climbing method whereby the steelworker wraps both his arms and legs around a column and inches his way up. (T 15). To descend, the worker would slide down, again hugging the column with his arms and legs. (T 15, 20). The complainant concluded that this method of going up and down was a violation of safety regulation 29 CFR 1926.450(a)(1). Such regulation reads:

> Except where either permanant or temporary stairways or suitable ramps or runways are provided, ladders described in this subpart shall be used to give safe access to all elevations.

Subsequently a citation was issued charging a serious violation of the quoted safety standard. The citation alleged as follows:

Ladder(s) were not used to give safe access to all elevations:

At the addition on the north side of the main building, two employees who had been connecting steel girders descended approximately 14 feet to the ground by "sliding" down the columns, exposing the employees to the hazards of falls.

A penalty of $300.00 was proposed.

## DISCUSSION

Commission precedent establishes that "shinnying" (sometimes called "cooning") is not an acceptable alternative to compliance with requirements of Sec. 1926.450(a)(1). In Taylor Building Associates, 5 OSHC 1083 (1977), the Commission upheld a serious citation upon evidence that cooning exposed workers to a fall hazard of 60 feet. In Roanoke Iron and Bridge Works, Inc., 5 OSHC 1391(1977) the possible fall distance was 50 feet, and again, the Commission affirmed a serious citation.

The distance of a possible fall is an important factor in assessing the seriousness of a violation. In Kenneth P. Thompson Co., Inc., 8 OSHC 1696 (1980) the Commission ruled that failure to use a ladder to negotiate a height of 44 inches was only a de minimus violation. The Commission stated the facts bore only "a negligible relationship to safety."

In a more recent case, the Commission vacated a citation involving employee exposure to a 10 foot fall while straddling a horizontal beam. The Commission held there was insufficient proof that a recognizable

hazard was present. Bethlehem Steel Corporation., 10 OSHC 1264 (1981). The weight of that case as precedent here, however, is somewhat limited since it involved a safety belt standard where a hazard must be proved, rather than being presumed to exist as in Sec. 1926.450(a)(1).[1]

In the case at hand, I have concluded that although a violation has been shown, it ranks very low in gravity. The evidence indicates only brief exposure to danger by two experienced steelworkers in good physical condition in their mid-twenties. (T 22, 23). The liklihood of their falling while climbing or descending with their arms and legs wrapped around the steel column is remote at best. This was freely conceded by the government safety expert. (T 143). Considering the distances involved, the remoteness of possible serious injury, the brevity of exposure, the experience and physical condition of the workers, and the unrebutted evidence that shinnying is a normal and customary practice in the industry (T 22), I conclude an other-than-serious classification is appropriate, rather than serious.

---

(1) The safety belt standard was 29 CFR 1926.28(a) which reads:

> The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

A housekeeping item in the citation was also contested by respondent. However, since no proof was offered to rebut the government's prima facie case, and since no argument of respondent has been addressed to this item, the same will be affirmed.

The evidence and the record as a whole, support the following findings:

## FINDINGS OF FACT

1. Respondent, Midwest Steel Erection Company, Inc., is a corporation having a place of business at 440 West 43rd Street, Chicago, Illinois, where it engages in the business of steel erection and related activities.

2. Jurisdiction is not contested by respondent.

3. The parties have stipulated to the following facts:

- Two employees of respondent climbed up and down steel columns which were 14 feet high without use of a ladder.

- The ground was hard.

- If a serious violation is affirmed, the proper penalty is $300.00. If the charge is reduced to other-than-serious, no penalty should be imposed.

4. On July 14, 1981, an OSHA compliance office inspected one of respondent's construction sites at Lansing, Illinois, where a one-story building was being constructed.

5. Shinnying is a climbing technique whereby a steelworker wraps arms and legs around a steel column and inches his way up (or slides down to descend).

6. Shinnying is the usual method for steelworkers to go up and down steel columns.

7. Steelworkers must know how to shinny.

8. The two steelworkers involved were in their mid-twenties and were in good physical condition.

9. The possibility of injury under the circumstances of this case was extremely remote.

10. Debris was not kept cleared from the following areas: on the north side of the site, scrap lumber and forms with protruding nails were stacked and stored along a passage route, exposing employees to the hazards of lacerations and puncture wounds.

From the above findings, the following conclusions of law are reached:

## CONCLUSIONS OF LAW

1. Respondent was at all times material an employer engaged in a business affecting commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act.

2. Respondent was at all times subject to the requirements of the Act and the standards promulgated thereunder.

3. The Commission has jurisdiction of the parties and the subject matter of this proceeding.

4. As to Item 1 of Serious Citation No. 1, the charge of a serious violation should be reduced to an other-than-serious violation, and as such affirmed without penalty.

5. As to Item 1 of Other Citation No. 2, respondent violated provisions of 29 CFR 1926.25(a) for which no penalty should be imposed.

ORDER

Based upon the foregoing findings of fact and conclusions of law, it is now ORDERED that:

1. Item No. 1 of Serious Citation No. 1 is affirmed as an other-than-serious violation, and no penalty is imposed.

2. Item No. 1 of other-than-serious Citation No. 2 is affirmed and no penalty is imposed.

| v. | : | |
| CUYAHOGA VALLEY RAILWAY COMPANY, | : | |
| Respondent, | : | OSHRC Docket No. 76-1188 |
| UNITED TRANSPORTATION UNION, | : | |
| Authorized Employee Representative. | : | |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This is a case under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). An order of Judge Erwin Stuller is before the Commission for review under section 12(j) of the Act, 29 U.S.C. § 661(i). Judge Stuller, at the request of the Secretary, vacated a citation issued to Cuyahoga. We reverse and remand for additional proceedings.

I

Cuyahoga, which operates a railroad for Jones and Laughlin Steel Corporation, was inspected by an official of the Occupational Safety and Health Administration ("OSHA"). As a result of the inspection,

Cuyahoga was cited for a serious violation of section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1). According to the citation, Cuyahoga had failed to adequately instruct and enforce its rules concerning the coupling and uncoupling of its ingot buggy cars. Respondent had also allegedly failed to maintain adequate clearance between buggy cars.[1/]

At a calendar call hearing on August 24, 1976, the Secretary moved to vacate the citation. The Secretary claimed that the cited working condition was exempt from the Act's coverage due to section 4(b)(1) of the Act, 29 U.S.C. § 653(b)(1).[2/] The Secretary asserted that the Federal Railway Administration ("FRA") had exercised authority over the

---

1/ A description of the alleged violation contained in the citation states:

> On and prior to January 14, 1976, the employer failed to furnish his employees working in the area of the BOF Department, a place of employment which was free from a recognized hazard that was likely to cause death or serious harm to his employees in that the employer failed to:
>
> (A) Adequately instruct and enforce rules when employees are required to couple and/or uncouple ingot buggy cars with stools; or
>
> (B) Maintain an adequate clearance between ingot buggy stools to permit employees to perform their duties safely when it requires them to place themselves between two buggies.

2/ Section 4(b)(1) provides, in pertinent part:

> Nothing in this chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

cited working condition, pointing to 49 C.F.R. §§ 217.1 and 217.3(a).[3/] A member of the United Transportation Union ("the Union") appeared at the hearing and objected to the Secretary's motion. The Union, which represents employees affected by the alleged violation, claimed that OSHA authority over the cited working condition was not preempted because Cuyahoga's operation of an intraplant railroad is not covered by regulations of the FRA. Specifically, the Union pointed to 49 C.F.R. § 217.3(b)(1), which says that the FRA's regulations in 49 C.F.R. § 217 do not apply to "[a] railroad that operates only on track inside an installation which is not part of the general railroad system of transportation."

Judge Stuller took the matter under advisement and instructed the Union to submit "something in writing." He did not specify any time to the instruction. On September 1, 1976, an attorney representing the Union wrote to the judge, recounting the proceedings at the calendar call

---

3/ These sections provide:

> § 217.1 Purpose.
>
> Through the requirements of this part, the Federal Railroad Administration learns the condition of operating rules and practices with respect to trains and other rolling equipment in the railroad industry, and each railroad is required to instruct its employees in operating practices.
>
> § 217.3 Application.
>
> (a) Except as provided in paragraph (b) of this section, this part applies to railroads that operate trains or other rolling equipment on standard gage track which is part of the general railroad system of transportation.

and informing the judge that, "unless advised to the contrary" the Union would file a brief "at the earliest possible date." On September 28, 1976, Judge Stuller entered an order vacating the citation. Judge Stuller had not given further notice to the parties nor had he received the Union's brief. The judge simply recited the Secretary's concession that the FRA had authority and noted that he had not received the Union's brief. The Union submitted its brief on September 29, 1976.

Commissioner Cleary directed that the judge's order be reviewed[4/] on the following question:

> Whether the administrative law judge erred in vacating the citation and notification of proposed penalty based on the Secretary's determination that pursuant to section 4(b)(1) of the Act the Secretary did not have authority to issue the citation?

II

Cuyahoga argues that the FRA has authority over the matter and not OSHA. Cuyahoga asserts that while part of its operation is an intraplant railroad, it also serves as a common carrier with switching operations for other customers outside the Jones and Laughlin Steel plant. Therefore, Cuyahoga is not an entirely intraplant railroad and does not come under the section 217.3(b)(1) limitation. Cuyahoga argues that OSHA jurisdiction is preempted under section 4(b)(1) because the FRA has statutory authority over the cited working conditions.

Cuyahoga also challenges the Union's right to object to the Secretary's motion to dismiss the case. Cuyahoga claims the Union only has party status to object to the reasonableness of the abatement period, relying on UAW Local 588 (Ford Motor Co.), 76 OSAHRC 58/B8, 4 BNA OSHC

---

4/ Former Commissioner Moran also directed review "for error."

1243, 1976-77 CCH OSHD ¶ 20,737 (No. 2786, 1976) ("UAW"), aff'd, 557 F.2d 607 (7th Cir. 1977).

The Secretary agrees with Cuyahoga that an authorized employee representative has no right to object to the Secretary's decision to withdraw a citation. The Secretary also asserts that, on the evidence available, he has determined that a section 4(b)(1) exemption exists for all of the citation except those parts which allege that Cuyahoga failed to enforce coupling and uncoupling rules and failed to maintain an adequate safe clearance between ingot buggy stools. These aspects of Cuyahoga's operations were not covered by FRA regulations but rather Cuyahoga's operating rules. The Secretary states, ". . . that an employer's formulation of rules pursuant to requirements of an agency does not constitute an exercise of statutory authority by an agency under section 4(b)(1)." However, the Secretary states that he also determined that no useful purpose "with respect to employee safety or the proper allocation of the Secretary's resources would be served by litigation of these additional allegations."

III

The Commission recently overruled UAW and held that the interests of an authorized employee representative that has elected party status in a timely manner are not restricted to the reasonableness of the abatement period. Mobil Oil Corp., 82 OSAHRC , 10 BNA OSHC 1905, 1982 CCH OSHD ¶ 26,187 (No. 77-4386, 1982). The Union, as a party in the case, may object to the Secretary's motion to withdraw the citation. See Mobil Oil Corp., supra. Although Judge Stuller properly heard the Union's objections to the Secretary's motion to withdraw, he erred in

ruling on the motion without receiving the Union's brief and considering the merits of its objection.[5/]

Accordingly, we set aside the judge's order and remand the case to the chief administrative law judge[6/] to consider the Union's objections to the withdrawal of the citation.[7/]

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: OCT 29 1982

---

5/ Chairman Rowland adheres to his position in Mobil Oil Corp., supra (dissenting opinion). The Chairman believes that the decision to withdraw a citation is within the prosecutorial discretion of the Secretary and therefore he would affirm Judge Stuller's decision.

6/ Judge Stuller has retired.

7/ Commissioner Cottine presumes that the Secretary will proceed appropriately on the merits if the Union's objections are found to be meritorious and the withdrawal motion is denied. See Dunlop v. Bachowski, 421 U.S. 560, 574-76 (1975).

CLEARY, Commissioner, concurring:

I concur in remanding this case for consideration of the Union's objection to the Secretary's withdrawal of the citation. As the Commission has stated: "The Secretary cannot be permitted to exercise prosecutorial discretion in a manner that would interfere with the right of affected employees to be heard as parties protecting their interest." IMC Chemical Group, 78 OSAHRC 95/C14, 6 BNA OSHC 2075, 2077, 1978 CCH OSHD ¶ 23,149 at p. 27,990 (No. 76-4761, 1978), rev'd, 635 F.2d 544 (6th Cir. 1980). If the Secretary chooses not to prosecute a citation in a case in which employees or their authorized representative have elected party status, the citation may be prosecuted by the employee party. Id.; see Mobil Oil Corp., 82 OSAHRC ____, 10 BNA OSHC 1905, 1927-28, 1982 CCH OSHD ¶ 26,187 at p. 33,041 (No. 77-4386, 1982) (concurring opinion).

Although the lead opinion does not refer to the Commission's decision in IMC Chemical Group, that decision remains Commission precedent and the judge is obliged to follow it on remand. Grossman Steel & Aluminum Corp., 76 OSAHRC 56/D9, 4 BNA OSHC 1185, 1975-76 CCH OSHD ¶ 20,691 (No. 12775, 1975). Thus, the judge should grant the Secretary's motion to withdraw the citation only if he concludes that the Union's objections are without merit as a matter of law. If he finds merit in the objections, he should deny the Secretary's motion and schedule the case for a hearing. If the Secretary declines to appear at the hearing to prosecute the citation, the judge should permit the Union to prosecute if it chooses to do so.

|---|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>CUYAHOGA VALLEY RAILWAY COMPANY<br>Respondent. | ) | DOCKET NO. 76-1188 |

ORDER

At the calendar call of the above case in Cleveland, Ohio,on August 24, 1976, the parties appeared and indicated that they had a basis for disposing of the case.

Complainant's counsel stated that he has determined that the regulation of the Department of Transportation, Federal Railroad Administration fits the description of the violation alleged herein and therefore pursuant to section 4(b)(1) of the Occupational Safety and Health Act of 1970, (29 U.S.C. 653(b)(1)) the complainant was without authority in issuing the citation in question.

The representative of the affected employees then asked leave to file a legal brief contesting the complainant's position. That brief has not been received. Based on the foregoing the citation and notification of proposed penalty herein are VACATED.

| v. | : | OSHRC Docket No. 79-1177 |
| FARMERS COOPERATIVE GRAIN AND SUPPLY COMPANY, | : | |
| Respondent. | : | |
| | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor ("Secretary") cited Farmers Cooperative Grain and Supply Company ("Farmers Co-op") for allegedly violating section 5(a)(1) of the Occupational Safety and Health Act of 1970[1/] by failing to prevent excessive accumulations of grain dust in certain areas of its workplace. Following a hearing on the merits, Administrative Law Judge John A. Carlson vacated the citation on the basis that the Secretary did not prove Farmers Co-op or its industry recognized that the dust conditions at Farmers Co-op's facility were hazardous.

---

1/ 29 U.S.C. §§ 651-678 ("the Act"). Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5.(a) Each employer —
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

Commissioners Cleary and Cottine directed review of the judge's decision pursuant to section 12(j) of the Act, 29 U.S.C. § 661(i).

During the proceedings before the judge, the parties discussed the possible applicability of the specific housekeeping standard at 29 C.F.R. § 1910.22(a)(1)[2/] to the conditions that were the subject of the citation. According to the Secretary, the dust accumulations in Farmers Co-op's workplace gave rise to a fire and explosion hazard. Counsel for the Secretary stated that the Secretary was not proceeding under section 1910.22(a)(1) because of the uncertain application of that standard to conditions creating fire and explosion hazards. After this case was directed for review, certain court and Review Commission decisions held that section 1910.22(a)(1) does apply to the allegedly hazardous conditions cited in this case. In Bunge Corp. v. Secretary of Labor, 638 F.2d 831 (5th Cir. 1981), the court rejected the argument that section 1910.22(a)(1) is limited to slipping and tripping hazards and explicitly held that the standard applies to fire and explosion hazards resulting from excessive grain dust accumulations. The Commission subsequently followed Bunge in holding that "the standard is directed not merely to sanitation but to all hazards arising from poor housekeeping . . . ." Pratt & Whitney Aircraft, 81 OSAHRC 39/A2, 9 BNA OSHC 1653, 1659, 1981 CCH OSHD ¶ 25,359 at p. 31,506 (No. 13401,

---

2/ This standard provides:

§ 1910.22 General requirements.

(a) Housekeeping. (1) All places of employment, passageways, storerooms, and service rooms shall be kept clean and orderly and in a sanitary condition.

1981), appeal withdrawn, No. 81-4104 (2d Cir. Aug. 3, 1981). Accordingly, the Commission issued a supplemental briefing order asking the parties' views on the potential applicability of section 1910.22(a)(1) as well as other standards.[3/] In response, both parties agree that section 1910.22(a)(1) applies to the facts of this case. The Secretary moves to amend the citation to allege that Farmers Co-op violated section 1910.22(a)(1). Farmers Co-op opposes the amendment.

We agree with the parties that section 1910.22(a)(1) applies to the hazard alleged to exist in this case: the potential for fire and explosion from excessive accumulations of grain dust. See Bunge Corp. v. Secretary of Labor, supra; Pratt & Whitney Aircraft, supra; see also Con Agra, Inc. v. OSHRC, 672 F.2d 699 (8th Cir. 1982). Where a specific standard applies to the facts of a case, citation under section 5(a)(1) is inappropriate. Mississippi Power & Light Co., 79 OSAHRC 109/D2, 7 BNA OSHC 2036, 1980 CCH OSHD ¶ 24,146 (No. 76-2044, 1979). However, for the reasons given in this opinion, we conclude that the parties impliedly consented to try a violation of section 1910.22(a)(1) and therefore grant the Secretary's motion to amend the citation to allege a violation of that standard. We affirm the amended citation as a repeated violation of the Act and assess a penalty of $640.

I

Farmers Co-op operates a grain elevator in Garretson, South Dakota. The elevator is used for the storage of grain and animal feed

---

3/ The supplemental briefing order also mentioned standards at 29 C.F.R. § 1910.176(c), which applies to housekeeping conditions in storage areas, and 29 C.F.R. § 1910.141(a)(3), which contains housekeeping requirements directed at maintaining proper sanitation. The parties do not contend that either of these standards applies to this case.

ingredients, such as soybean meal. In March, 1978, the facility was inspected by an OSHA compliance officer, and the Secretary subsequently cited Farmers Co-op for violating section 5(a)(1) of the Act by failing to implement a housekeeping program to prevent excessive accumulations of grain dust. Farmers Co-op contested the citation but, as part of a settlement to resolve that citation together with certain others, Farmers Co-op withdrew its notice of contest and agreed to abate the violation. The abatement program the company implemented consisted of the removal of grain dust accumulations twice a week by the use of vacuum cleaners and brooms.

On February 16, 1979, the compliance officer reinspected Farmers Co-op's Garretson elevator. He observed grain dust accumulations as high as 20 inches deep in two of the same locations that were the subject of the earlier citation. As a result of his observations, the Secretary issued to Farmers Co-op a citation alleging a repeated violation of section 5(a)(1).

According to the compliance officer, the dust accumulations resulted primarily from spillage of material during the storage process. The grain and feed ingredients to be stored are brought to the elevator by local farmers and are dropped through a metal grating in the floor. The material is then raised by a bucket-leg elevator to the top of the facility and is dropped into a turret, from which it is distributed to a series of storage bins through a number of spouts. The compliance officer testified that the major source of spillage resulted from dust located in already-filled bins "boiling up" through the turret when another bin was being loaded. He suggested that this problem could be alleviated by a plate over the turret with an opening for only one

spout. The plate would be rotated so that the spout opening was over the bin being filled and would prevent dust from other bins backing up through the turret. The compliance officer suggested that spillage could be further reduced by making the spouts airtight, and that excessive accumulations could be prevented by a more strenuous program of cleaning up dust that had spilled. The OSHA area director for the Sioux Falls, South Dakota, office, who had accompanied the compliance officer on the inspection, suggested that an aspiration system that would maintain a slight positive pressure in the elevator leg would help control grain dust spillage.

The compliance officer testified that grain dust in the concentrations he observed created a fire and explosion hazard. The dust could spontaneously ignite or could burn or explode if ignited by an outside source.

The manager of Farmers Co-op's Garretson elevator, Mr. Top, testified that spills of material were a problem due to the age of the structure and the equipment. When spills occurred, they were cleaned up and, if the spillage resulted from faulty equipment, the equipment was repaired. Normal accumulations of dust were an inevitable result of their operations, and feed ingredients, which were being handled at the time of the reinspection, were particularly dusty. These normal accumulations were supposed to be cleaned up twice a week, on Tuesdays and Fridays. However, at the time of the reinspection by the OSHA compliance officer, which was on a Friday, the last cleaning had occurred on the previous Friday.

Mr. Moe, the supervisor for Farmers Co-op in direct charge of the housekeeping program, also testified that the last cleaning had oc-

curred a week before the reinspection. He stated that it was the normal policy to clean up on Tuesdays and Fridays, but that they would put it off a day or so if they were exceptionally busy. He did not state any reason why the Tuesday cleaning that was supposed to occur prior to the reinspection did not take place.

II

Rule 15(b) of the Federal Rules of Civil Procedure[4/] seeks to promote resolutions of cases on their merits rather than on the technicalities of pleadings. See Usery v. Marquette Cement Manufacturing Co., 568 F.2d 902 (2d Cir. 1977); National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973). Where, as in this case, the amendment seeks to introduce a new legal theory and does not add any new questions of fact, consent to the amendment under Rule 15(b) will be implied where the party opposing amendment has introduced or failed to object to evidence relevant to the unpleaded issue and that party would not be prejudiced by the amendment. See Crawford Construction Co., 82 OSAHRC _____, 10 BNA OSHC 1522, 1525, 1982 CCH OSHD ¶ 25,984 at

---

4/ Rule 15(b) provides, in pertinent part:

> Rule 15. Amended and Supplemental Pleadings.
>
> * * *
>
> (b) AMENDMENTS TO CONFORM TO THE EVIDENCE. When issues not raised by the pleadings are tried by express or implied consent of the parties, they shall be treated in all respects as if they had been raised in the pleadings. Such amendment of the pleadings as may be necessary to cause them to conform to the evidence and to raise these issues may be made upon motion of any party at any time, even after judgment; but failure so to amend does not affect the result of the trial of these issues . . . .

32,605 (No. 79-928, 1982), and cases cited therein. See also Mineral Industries & Heavy Construction Group v. OSHRC, 639 F.2d 1289, 1293 (5th Cir. 1981).

The factual issues relevant to an alleged violation of section 1910.22(a)(1) concern the nature and extent of the grain dust accumulations in Farmers Co-op's workplace. This issue was squarely presented by the citation alleging a violation of section 5(a)(1) of the Act and was fully tried by the parties. Farmers Co-op introduced evidence relevant to the section 1910.22(a)(1) issue and did not object to evidence introduced by the Secretary relating to the issue. In fact, Farmers Co-op introduced the issue of the applicability of section 1910.22(a)(1) into these proceedings. Moreover, Farmers Co-op has had the opportunity, in response to the supplemental briefing order, to show how it would be prejudiced by the amendment and does not contend that it could offer any other evidence relevant to the unpleaded charge or that it was otherwise prejudiced. Accordingly, the Secretary's motion to amend is granted.

We further conclude that Farmers Co-op violated section 1910.22 (a)(1). It is undisputed that the accumulations of grain dust in Farmers Co-op's facility were excessive and gave rise to a fire and explosion hazard. Farmers Co-op's witnesses, Mr. Top and Mr. Moe, questioned the feasibility of certain of the means the Secretary's witnesses suggested to minimize the accumulations, such as the turret cover recommended by the compliance officer and the aspiration system mentioned by the area director. However, the Secretary does not bear the burden of proving the feasibility of a means of abatement under a specific standard as he does under section 5(a)(1). See S & H Riggers

and Erectors, 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1265-66, 1979 CCH OSHD ¶ 23,480 at p. 28,438 (No. 15855, 1979), rev'd on other grounds, 659 F.2d 1273 (5th Cir. 1981). Under the standard, Farmers Co-op would have to prove, as an affirmative defense, that compliance was either impossible or that it would prevent the performance of necessary work. Id. Although Farmers Co-op's witnesses testified that some accumulations of grain dust were inevitable, they did not assert that the accumulations could not be reduced below the levels present at the time of the reinspection. Indeed, the record shows that those excessive levels resulted from Farmers Co-op's failure to adhere to its own maintenance schedule. Even if full compliance with a standard cannot be achieved, an employer must nevertheless protect its employees to the extent possible against the hazards to which standards are directed. See M. J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1146-47, 1979 CCH OSHD ¶ 23,330 at p. 28,230 (No. 15094, 1979). Thus, even if Farmers Co-op had contended that compliance was impossible, the record would not support that contention.

III

We turn now to the question of whether the violation is properly classified as repeated. This classification is proper if, at the time the violation occurred, there was a Commission final order against the employer for a substantially similar violation. Potlatch Corp., 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 1063, 1979 CCH OSHD ¶ 23,294 at p. 28,171 (No. 16183, 1979).[5/] The requirement of substantial similarity per-

---

5/ Accord, J. L. Foti Constr. Co. v. OSHRC, No. 80-3806 (6th Cir. Sept. 7, 1982); Kent Nowlin Constr. Co. v. OSHRC, 648 F.2d 1278 (10th Cir. 1981); Bunge Corp. v. Secretary of Labor, 638 F.2d 831 (5th Cir. 1981); George Hyman Constr. Co. v. OSHRC, 582 F.2d 834 (4th Cir. 1978).

tains to the hazards involved in the present and preceding violations. It is not necessary that the two violations involve the same standard or section of the Act. Id.

In this case, both the present violation and the earlier violation involve the same conditions and the same hazards: excessive grain dust accumulations giving rise to a hazard of fire and explosion. Indeed, the areas in which the present violation occurred were specifically covered in the previous citation. Thus, the violations are substantially similar despite the fact that the earlier citation became a final order under section 5(a)(1) while in this case we are finding that Farmers Co-Op violated section 1910.22(a)(1). Moreover, the first citation was a final order at the time this violation occurred. The settlement agreement affirming that citation was approved by an administrative law judge on Nov. 2, 1978. The judge's order was not directed for review and therefore became a final order of the Commission on December 2, 1978, more than two months before the violation alleged in this case.

We also note that our decision in Potlatch Corp., supra, was issued before the violation in this case occurred. Thus, at all material times, Farmers Co-op was on notice that it could be found in repeated violation of the Act for violations involving a hazard substantially similar to that in the earlier citation regardless of whether the same section of the Act was violated. Accordingly, our granting of the motion to amend does not prejudice Farmers Co-op's defense to the repeated allegation.

In assessing a penalty, we must consider the gravity of the violation together with Farmers Co-op's size, good faith, and history of

previous violations. 29 U.S.C. § 661(i). The gravity of the violation was substantial as the excessive accumulations of grain dust exposed several employees to the possibility of death or serious injury should a fire or explosion occur. Moreover, Farmers Co-op's good faith is questionable as the company offered no satisfactory explanation for the reoccurrence of conditions that had been the subject of a previous citation. However, Farmers Co-op is a relatively small employer. It has only eight employees at its Garretson elevator and operates one smaller grain elevator in addition to the Garretson facility. On balance, we conclude that the Secretary's proposed penalty of $640 is appropriate.

IV

Accordingly, the judge's decision is set aside. The Secretary's motion to amend the citation to allege that Farmers Co-op violated 29 C.F.R. § 1910.22(a)(1) is granted and, as so amended, the citation is affirmed as a repeated violation. A penalty of $640 is assessed. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: OCT 29 1982

ROWLAND, Chairman, dissenting:

Despite the fact that the Secretary declined to try this case under the standard at 29 C.F.R. § 1910.22(a)(1),[1/] the majority concludes that the parties consented to try a violation of that standard. This conclusion is inconsistent both with Rule 15(b) of the Federal Rules of Civil Procedure and with this Commission's role as an impartial adjudicator under the Occupational Safety and Health Act. I would vacate the citation because citation under section 5(a)(1) is inappropriate when a specific standard is applicable and the parties did not consent to try the unpleaded issue of whether Farmers Co-op violated section 1910.22(a)(1).

At the outset of the hearing, Farmers Co-op moved to dismiss the 5(a)(1) charge on the basis that section 1910.22(a)(1) applied to this case. Although the Secretary was aware of long-standing Commission precedent holding that a section 5(a)(1) charge cannot stand where a specific standard applies,[2/] and although the Secretary had previously cited other employers under section 1910.22(a)(1) in circumstances similar to this case,[3/] the Secretary explicitly decided to continue to pursue this case under section 5(a)(1). The hearing that followed focused on the various aspects of a section 5(a)(1) charge, particularly recognition of the hazard and feasibility of the means of abatement. See Jones & Laughlin Steel Corp., 10 BNA OSHC 1778, 1982 CCH OSHD

---

1/ See note 2 of the lead opinion.

2/ See, e.g., Brisk Waterproofing Co., 73 OSAHRC 30/E1, 1 BNA OSHC 1263, 1973-74 CCH OSHD ¶ 16,345 (No. 1046, 1973).

3/ See Bunge Corp. v. Secretary of Labor, 638 F.2d 831 (5th Cir. 1981).

¶ 26,128 (No. 76-2636, 1982). Only after this case was directed for review, and after Commission and court decisions held that section 1910.22(a)(1) did indeed apply to the types of hazard alleged to exist in this case, did the Secretary move to amend on the basis that the parties had implicitly "consented" to try the case under the standard.

In agreeing with the Secretary, the majority offers two reasons why Farmers Co-op implicitly consented to the amendment: the company (1) introduced or failed to object to evidence relevant to the unpleaded issue, and (2) would not be prejudiced by the amendment. These reasons are unpersuasive. All of the evidence introduced at the hearing relevant to a charge under section 1910.22(a)(1) was also relevant to the pleaded section 5(a)(1) charge. Therefore, Farmers Co-op's participation in the introduction of such evidence can hardly be taken as implying its consent to try an unpleaded charge.[4/] McLean-Behm Steel Erectors v. OSHRC, 608 F.2d 580 (5th Cir. 1979). Essentially, then, the majority's rationale reduces to the proposition that an employer who proceeds to trial under one legal theory consents to any subsequent change in that theory that will not prejudice the employer. And because an amendment that changes the legal theory is viewed by the majority as a mere "technicality," it is difficult to envision how an

---

4/ A party's failure to object to evidence that is relevant to a pleaded issue does not demonstrate that the party believed it was trying an unpleaded issue. McLeod v. Stevens, 617 F.2d 1038 (4th Cir. 1980); 6 C. Wright and A. Miller, Federal Practice and Procedure § 1493 (1971). Indeed, such an objection would lack merit and would only serve to delay the proceedings. A party may, and should, object to evidence that is not relevant to the issues framed by the pleadings. A party's failure to make such an objection is an indication that the party considered the evidence relevant to an unpleaded issue. Niedland v. United States, 338 F.2d 254 (3d Cir. 1964).

employer would be able to show it was prejudiced by such an amendment. Thus, the Secretary is free to proceed to trial under an erroneous legal theory secure in the knowledge that the Commission will view his decision as a "technicality" and will ultimately amend to the correct theory.

Although in this case the Secretary ultimately moved to amend to section 1910.22(a)(1), it is significant that the majority's action in amending the citation does not depend on the Secretary having requested the amendment. In prior cases the Commission has ordered sua sponte amendments under Rule 15(b), saying:

> Despite "the failure of complainant to request an amendment," we have "no course but to amend the citation" if we find that an unpleaded charge has been tried by the express or implied consent of the parties.

Rogers Manufacturing Co., 79 OSAHRC 67/E2, 7 BNA OSHC 1617, 1620, 1979 CCH OSHD ¶ 23,800 at p. 23,878 (No. 76-896, 1979), citing Southwestern Bell Telephone Co., 78 OSAHRC 100/D8, 6 BNA OSHC 2130, 2133, 1978 CCH OSHD ¶ 23,187 at p. 28,033 (No. 14761, 1978). By taking it upon itself to decide under what legal theory an employer should be charged in such cases, the Commission acts as an associate prosecutor to the Secretary. Such actions are not ones that were envisioned by Congress, which expected that the Commission's role under the Act would be that of an impartial adjudicator. See Mobil Oil Corp., 10 BNA OSHC 1905, 1931-32, 1982 CCH OSHD ¶ 26,187 at pp. 33,044-45 (No. 77-4386, 1982) (dissenting opinion).

In my opinion, a finding of consent under Rule 15(b) is appropriate only when the parties squarely recognize at trial that they are try-

ing an unpleaded issue. Crawford Construction Co., 10 BNA OSHC 1522, 1982 CCH OSHD ¶ 25,894 (No. 79-928) (dissenting opinion), appeal filed, No. 82-3350 (6th Cir. May 27, 1982); Vicon Corp., 81 OSAHRC 98/C4, 10 BNA OSHC 1153, 1981 CCH OSHD ¶ 25,749 (No. 78-2923, 1981) (concurring opinion), aff'd, No. 81-2359 (8th Cir. Aug. 2, 1982). In this case, the Secretary's adherence to the section 5(a)(1) charge despite Farmers Co-op's motion to dismiss demonstrates that the parties did not believe the case was being tried under section 1910.22(a)(1). See Western Waterproofing Co. v. Marshall, 576 F.2d 139, 143-44 (8th Cir. 1978). The Secretary's motion to amend should be denied and the citation vacated.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>FARMERS COOPERATIVE GRAIN AND SUPPLY CO.,<br><br>Respondent. | OSHRC DOCKET NO. 79-1177 |

APPEARANCES:

Rochelle G. Stern, Esq. and Jaylynn K. Fortney, Esq., of Kansas City, Missouri, for the Complainant,

Charles N. Nauen, Esq. and Derald W. Wiehl, Esq., of Sioux Falls, South Dakota, for the Respondent.

DECISION AND ORDER

Carlson, Judge, OSHRC:

This contest, heard under provisions of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq., "the Act"), arose out of a February 16, 1979 inspection of respondent's grain elevator at Garretson, South Dakota by representatives of the complainant Secretary of Labor. Complainant issued a citation charging a "repeated" violation of the "general duty clause" of the Act[1/] because of alleged excessive

1/ The general duty clause, Section 5(a)(1) (29 U.S.C. §654(a)(1)) provides:

(a) Each employer --
(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

accumulations of grain dust at two locations within the facility.

The citation, as pertinent, reads:

> The employer failed to furnish employment and a place of employment which were free from recognized hazards causing or likely to cause death or serious physical harm to employees...in that a preventive maintenance housekeeping program complying with the requirements of Chapter 7 of NFPA No. 61-B "Standard for the Prevention of Fire and Dust Explosions in Grain Elevators and Bulk Grain Handling Facilities" was not in effect, resulting in accumulations of grain dust:
>
> a) In the south elevator headhouse.
>
> b) Near the spouts on the first landing.

Chapter 7 of the NFPA (National Fire Protection Association) No. 61B provides:

> Good housekeeping and clean premises are the first essentials for elimination of dust explosion hazards, consequently this standard is not intended to lessen in any way the responsibility of the owner or operator in this respect. It should also be emphasized that any potential fire cause may produce a dust explosion.
>
> Dust on floors, ledges, girders, machinery, spouting and other surfaces, including all galleries and tunnels shall be removed concurrently with operations to prevent accumulation of such dust.
>
> Spills and chokes shall be cleaned up without delay.
>
> The use of compressed air or other means to blow dust from ledges, walls, and other areas which will create a dust explosion hazard shall not be permitted unless all machinery in the area has been shut down and all sources of ignition removed.

Jurisdiction of the Commission is not in issue. Following the July 27, 1979 hearing of the contest, both parties filed briefs, and complainant also filed proposed findings of facts and conclusions of law.

## BACKGROUND AND DISCUSSION

I

Respondent's facility includes a "south" and "north" elevator. Grains placed in the south elevator were often ground or mixed in an adjoining feed mill; the north elevator serves for handling and storage only (Tr. 144-155). The elevators are of wood-crib construction. During normal operations three employees worked within the elevators.

Complainant's inspecting compliance officer observed and measured grain dust accumulations of up to 20 inches in the headhouse of the south elevator (Tr. 20-24, 28, 31). In the headhouse landing of the north elevator, he saw and measured up to 10-inch accumulations (Tr. 32-33). Photographs taken at both locations tend to confirm these observations (complainant's exhibits 4-10). The compliance officer testified that excessive accumulations of dust could cause or contribute to fire or explosion. Heavy grain dust accumulations, he maintained, could ignite spontaneously, could burn if ignited by an outside source, or could add force to an explosion (Tr. 23-24, 33-36, 43). He was of the opinion that fire or explosion in the grain elevator would result in serious injury or death to employees working in the structures (Tr. 43). His superior, the OSHA Area Director, who was also present at the inspection, confirmed the compliance officer's opinions (Tr. 80-81, 91).

Complainant's witnesses advocated abatement of the south elevator's accumulation by installation of a "turn head plate" which would prevent "boiling" of dust from bins adjoining the bin actually being filled. The Area Director alternatively suggested individual covers. For all areas these witnesses recommended supression of leaks in the spouting system and a pressurized aspiration system to carry away dust before

it settled. These measures all aim toward elimination of sources of dust build-up. Complainant's witnesses also indicated that abatement was possible through periodic but timely use of brooms and vacuum cleaners to remove settled dust before accumulations became excessive (Tr. 24, 26, 29, 32-33, 36-37, 58-59, 83-84, 91, 96, 98).

Respondent's witnesses did not deny the accuracy of the compliance officer's observations concerning the amounts of dust accumulation (Tr. 144). Respondent's manager testified that since the time of the prior citation, employees had removed dust accumulations twice weekly with brooms and a vacuum system (Tr. 122-123). The accumulations found were not uncommon for a 1 to 4 day period (Tr. 126, 152), respondent's witnesses indicated, although dust levels were somewhat elevated because of additional grain handling. This was necessitated by changes in respondent's feed mill operation required as a result of complainant's earlier inspection (Tr. 112, 113, 118, 126).

II

Respondent raises several earnest defenses. First, it contends that because National Fire Protection Association standards mentioned in the citation were never promulgated as federal standards by the Secretary, the citation must fail. In this regard it relies primarily on Morrow County Grain Growers, Inc., No. 78-1938, an unreviewed judge's decision. That decision does mention that the NFPA provisions were not adopted by the Secretary as standards under the Act, but that observation was merely prefatory to the holding that the cited provisions had no effect under a general duty charge. This was so, the case held, because the 1973 version of the NFPA applies only to facilities built

after its adoption.

Under the general duty clause, the Secretary must prove (1) that the employer failed to render its workplace free of a hazard which was (2) recognized and (3) causing or likely to cause death or serious physical harm. National Realty and Construction Co., Inc., 489 F.2d 1257 (D.C. Cir., 1973). A "recognized" hazard is one within the actual knowledge of the employer or the knowledge of the industry of which he is a part. Brennan v. OSHRC and Vy Lactos Laboratories, Inc., 494 F.2d 460 (8th Cir., 1974).

The Commission has held that any applicable national consensus standards[2/] should be considered in determining whether a "recognized" hazard exists under the general duty clause. Betten Processing Corporation, 75 OSAHRC 43/E2, (No. 2648, 1975). Since the Secretary may always seek to show hazard recognition by consensus standards, mere reference to NFPA provisions cannot, of itself, vitiate a citation.

A closely related defense, however, has merit. Respondent maintains that the 1973 NFPA provisions apply only to facilities built after 1973. Respondent built its elevator before 1918 (Tr. 111).

Under the heading "Scope" the standard provides at 61B-6:

> This standard shall apply to facilities erected subsequent to the date of this standard, and is presented as an advisory guide for owners and operators who may wish to avail themselves of the information herein contained in major replacement or renovation of existing facilities.

Respondent stresses that its structures and equipment are old; and that the structures have design and air movement characteristics which differ substantially from those of "tight" terminal elevators and more

2/ See Section 3(9) of the Act.

modern country facilities. Complainant's own witness, respondent points out, acknowledges these differences. Respondent's manager asserted that the design of the elevator would not allow effective use of the means advocated for prevention of accumulations -- particularly "aspiration" or "pressurization." (Tr. 119-121, 125-126, 128-129, 132.) Such problems, respondent suggests, furnish the reason for an NFPA exemption for old elevators.

The exemptive matter was raised by respondent at the outset of the evidentiary hearing (respondent's motion, J-2, Tr. 5-6, 89); ruling was reserved, and complainant asked permission to file a brief (Tr. 6). Despite this, the matter has not been directly addressed by the Secretary.

The words of the NFPA are plain. The standard has no direct application to respondent's elevator. May it somehow apply indirectly? I think not. The doctrine in Betten must surely cut both ways. An employer who has constructive knowledge of the substantive parts of a national consensus standard applying to his industry, must surely be said to have similar knowledge of those parts which exempt his enterprise. Moreover, it is settled that mere "advisory" standards cannot be the basis for a violation of the Act, even where they have been formally adopted by the Secretary. Kennecott Copper Corp., 76 OSAHRC 81/A2, (No. 5959, 1976), aff'd Usery v. Kennecott Copper Corp., 577 F.2d 1113 (10th Cir., 1977). This reasoning must apply with even greater force to exemptive provisions. When he treats the NFPA as authoritative, the Secretary must give similar treatment to respondent's reliance upon its exemptions. The exemptions, too, are authoritative.

Complainant was permitted to introduce the earlier 1959 version of

the NFPA grain elevator standards (complainant's exhibit 17, Tr. 85-89), which also has a chapter on dust removal (Chapter 6). That version is no better, however, since it specifically applies only to facilities built after 1959. Also, of course, it has been superseded; the 1973 version was effective at the times material in this case.

One must now ask whether the record supports a finding of violation without reference to the NFPA. I hold that it does not. That the citation alleged that respondent did not "comply" with the NFPA is not pivotal -- though it is representative of the intensity with which complainant adhered to his NFPA theory of violation. Of pivotal importance is that complainant did not prove the "recognized hazard" element of a general duty clause violation by any other evidence. Respondent's manager made clear his belief that the conditions at its facility did not constitute a hazard recognized by country elevator operators (Tr. 129-132, 144-145). Complainant, in his brief, maintains that his Area Director gave testimony establishing an industry-recognized hazard. The testimony referred to, however, was chiefly his endorsement of the NFPA as "authoritative" (Tr. 85). Beyond that there was only the following:

> Q Mr. Hines, I'd like to know if, in your opinion, or do you know if the industry recognizes poor housekeeping as a hazard in grain elevators?
>
> A I would say a part of the industry doesn't in the State of South Dakota. (Tr. 85.)

Such testimony adds nothing to the sum of complainant's proofs.

III

That the respondent had received a prior citation charging precisely the same violation in the same words (complainant's exhibit 3) adds nothing to the evidence of the present violation. The earlier citation

was contested by respondent, was later settled, and, when approved and affirmed by a Commission judge, became final (complainant's exhibits 1 and 2). This settlement does not diminish the breadth of respondent's rights in the present case, nor does it reduce complainant's burden of proof.[3/] Particularly, respondent's agreement to an affirmation was not a confession that it recognized the hazard for purposes of future charges growing out of a citation for a fresh violation. Complainant does not, in other words, make out a case for "actual knowledge" of a hazard because of respondent's abatement efforts stemming from an earlier citation based upon the inapplicable NFPA.

IV

One more matter deserves mention. Nothing in this record warrants amendment by this judge to charge a violation of any of the Secretary's specific safety standards in lieu of the general duty clause. The question collaterally intrudes since respondent has contended that the general duty clause had no application; and that if any violation occurred, complainant should have looked in the direction of specific standards at 29 C.F.R. §1910.22(a)(1) or §1910.141(a)(3).[4/] Counsel for the Secretary declined to amend when an opportunity presented itself early in the hearing (Tr. 8), has never since asked to amend, and has not briefed the matter. A sua sponte amendment under Rule 15(b) of the Federal Rules of Civil Procedure under these circumstances is inappropriate. The issue was not tried by the consent of either party. Complainant clearly wished to

3/ Cf. York Metal Finishing Co., 74 OSAHRC 19/D2, (No. 245, 1974).

4/ See Brisk Waterproofing Co., Inc., 73 OSAHRC 30/E1, (No. 1046, 1973).

rely on the general duty clause; respondent's potential defenses against any alleged violation of a specific standard are unknown.

## FINDINGS OF FACTS

Upon the entire record, it is found:

(1) Respondent operates a grain handling facility at Garretson, South Dakota.

(2) The facility includes two adjoining elevators, both made of wood and built in about 1918. Three employees ordinarily worked within the elevators.

(3) In a safety inspection conducted on February 16, 1979, representatives of the Secretary of Labor found accumulations of grain dust measuring a maximum of 20 inches on the headhouse floor in the south elevator. The inspectors found a maximum of 10 inches of dust on the first landing in the north elevator.

(4) The cited areas in both elevators had been cleaned by broom and vacuum on a twice-weekly basis commencing on October 20, 1978 when a settlement stipulation was executed resolving a citation issued April 5, 1978. That citation charged a violation virtually identical to that charged in the present contest.

(5) The preponderant evidence of record fails to show that respondent actually recognized the dust conditions existing in the cited areas as posing a hazard likely to cause death or serious physical harm, or that the industry of which respondent was a part recognized such a hazard.

## CONCLUSIONS OF LAW

It is concluded that:

(1) The Commission has jurisdiction to decide this case.

(2) The 1973 version of the National Fire Protection Association "Standard for the Prevention of Fire and Dust Explosions in Grain Elevators" exempts respondent's elevators.

(3) Respondent was not in violation of Section 5(a)(1) of the Act as charged in this case.[5/]

## ORDER

Accordingly, the citation and notification of proposed penalty are ORDERED vacated.

John A. Carlson
Judge, OSHRC

Dated: November 5, 1979

5/ Complainant's proposed findings of facts and conclusions of law, to the extent they differ with those entered above, are rejected.

| Complainant, | : | |
| v. | : | OSHRC Docket No. 79-3291 |
| SENCO PRODUCTS, INC., | : | |
| Respondent. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case is before the Commission for review under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Before a hearing on the merits, Administrative Law Judge George Taylor granted Respondent's ("Senco") motion to dismiss, holding that the standard under which Senco was cited had been improperly promulgated. We reverse Judge Taylor's decision and remand for further proceedings consistent with this decision.

I

In May 1979, a compliance officer of the Occupational Safety and Health Administration ("OSHA") inspected the Senco workplace. As a result of the inspection, the Secretary of Labor ("Secretary") issued a citation alleging that several Senco employees were exposed to a mixture of methyl ethyl ketone, xylene and acetone at levels that exceeded

the applicable limit for a mixture of these air contaminants specified in 29 C.F.R. § 1910.1000(d)(2)(i).[1/]

The history of section 1910.1000 is crucial to an understanding of this case. The Secretary promulgated section 1910.1000, originally codified at 1910.93, pursuant to section 6(a) of the Act.[2/] Section

---

1/ 29 C.F.R. § 1910.1000(d)(2)(i) provides:

> § 1910.1000 Air contaminants.
>
> An employee's exposure to any material listed in table Z-1, Z-2, or Z-3 of this section shall be limited in accordance with the requirements of the following paragraphs of this section.
>
> * * *
>
> (d) Computation formulae:
>
> * * *
>
> (2)(i) In case of a mixture of air contaminants an employer shall compute the equivalent exposure as follows:
>
> $Em = (C_1 \div L_1 + C_2 \div L_2) + \ldots (C_n \div L_n)$
>
> Where:
>
> Em is the equivalent exposure for the mixture.
>
> C is the concentration of a particular contaminant.
>
> L is the exposure limit for that contaminant, from table Z-1, Z-2, or Z-3.
>
> The value of Em shall not exceed unity (1).

2/ Section 6(a) provides, in pertinent part, that:

> Without regard to chapter 5 of Title 5 or to other subsections of this section, the Secretary shall, as soon as practicable during the period . . . ending two years after [the effective date of the Act] . . . by rule promulgate as an occupational safety

(continued on next page)

1910.1000 was based on an established Federal standard, 41 C.F.R. § 50-204.50, promulgated under the Walsh-Healey Public Contracts Act (41 U.S.C. §§ 35-45). See 29 C.F.R. § 1910.1499; see also 36 Fed. Reg. 10523 (May 29, 1971). The Walsh-Healey standard, section 50-204.50,[3/] referred to the pamphlet entitled "Threshold Limit Values ("TLV") of Airborne Contaminants for 1968" of the American Conference of Governmental Industrial Hygienists ("ACGIH"). The OSHA standard promulgated May 29, 1971 was very similar to the Walsh-Healey standard's references to the ACGIH pamphlet, except that the OSHA standard referred to the 1970 ACGIH TLVs rather than the 1968 ACGIH TLV's. Moreover, unlike the Walsh-Healey standard's reference to the ACGIH pamphlet, the OSHA standard explicitly set forth the substances listed in the ACGIH booklet and the TLVs for these substances. The TLVs were those listed in the 1970 ACGIH booklet rather than the 1968 version.

Neither the Walsh-Healey standard nor the May OSHA standard specifically referred to the mixtures provision contained in an appendix to the ACGIH table of TLVs.[4/] In August 1971, the Secretary repromul-

---

2/ (continued)

> or health standard any national consensus standard, and any established Federal standard, unless he determines that the promulgation of such a standard would not result in improved safety or health for specifically designated employees. . . .

According to section 3(10) of the Act, an established Federal standard is "any operative occupational safety and health standard established by an agency . . . or contained in any Act of Congress . . . ."

3/ The pertinent portions of section 50-204.50 are quoted in the text infra.

4/ The mixtures provision in the appendices of both the 1968 and 1970 ACGIH pamphlets stated:

(continued on next page)

gated section 1910.1000 after revision "in the interest of greater intelligibility and accuracy."[5/] This repromulgated standard did not refer to any ACGIH publication but instead contained tables listing specific substances and their TLVs. Most of the TLVs were taken from the 1968 ACGIH table. Additionally, the repromulgated standard now explicitly set forth the mixtures provisions pertinent to this case. The new mixtures section provided,

> An employee's exposure to any material listed in table G-1 . . . shall be limited in accordance with the requirements of the following paragraphs of this section.

---

4/ (continued)

> When two or more hazardous substances are present, their combined effect, rather than that of either individually, should be given primary consideration. In the absence of information to the contrary, the effects of the different hazards should be considered as additive. That is, if the sum of the following fractions,
>
> $$\frac{C1}{T1} + \frac{C2}{T2} + \text{------} \frac{Cn}{Tn}$$
>
> exceeds unity, then the threshold limit of the mixture should be considered as being exceeded. . . .
>
> Exceptions to the above rule may be made when there is good reason to believe that the chief effects of the different substances are not in fact additive, but independent as when purely local effects on different organs of the body are produced by the various components of the mixture. In such cases the threshold limit ordinarily is exceeded only when at least one member of the series
>
> $$\left(\frac{C1}{T1} + \text{ or } + \frac{C2}{T2} \text{ etc.}\right)$$
>
> itself has a value exceeding unity. . . .

(Emphasis added)

5/ See 36 Fed. Reg. 15101 (Aug. 13, 1971).

* * *

(d) Computation formulae:

* * *

(2)(i) In case of a mixture of air contaminants an employer shall compute the equivalent exposure as follows:

$$Em = C_1 \div L_1 + C_2 \div L_2 + \ldots C_n \div L_n$$

Where:

Em is the equivalent exposure for the mixture.

C is the concentration of a particular contaminant.

L is the exposure limit for that particular contaminant, from table Z-1, Z-2, or Z-3.

The value of Em shall not exceed unity (1).

(Emphasis added)

II

In promulgating standards under section 6(a) of the Act, the Secretary was not required to adopt the source standards verbatim but he was not empowered to make substantive changes from the source standards. George C. Christopher & Sons, 82 OSAHRC , 10 BNA OSHC 1436, 1443, 1982 CCH OSHD ¶ 25,956 at p. 32,531 (No. 76-647, 1982). Senco argues that the mixtures provision under which it was cited was not a part of the Walsh-Healey standard, section 50-204.50, and therefore its inclusion in section 1910.1000 represents a substantive change from the source standard.

Senco also asserts that the standard is invalid if its source is considered to be the ACGIH document. The company contends that the ACGIH document is not an established federal standard or national consensus standard and therefore could not have been validly adopted un-

der section 6(a) of the Act. Senco also contends that there are substantive differences between the mixtures provision in section 1910.1000 and the ACGIH document. The OSHA mixtures provision, unlike the corresponding provision in the ACGIH document, is mandatory rather than advisory, and it also omits a specific exception for non-additive substances contained in the ACGIH mixtures provision. These changes, according to Senco, are substantive because they place different and more stringent obligations upon employers.

The Secretary contends that the source of section 1910.1000 was the Walsh-Healey standard and that the alterations made to the standard were insubstantial. The Walsh-Healey standard and the current standard essentially impose the same obligations on the employer. In making this contention, the Secretary points to several cases, including Deering Milliken, Inc., 78 OSAHRC 101/A2, 6 BNA OSHC 2143, 1978 CCH OSHD ¶ 23,191 (No. 12597, 1978), aff'd, 630 F.2d 1094 (5th Cir. 1980), in which the courts and the Commission have found certain changes in source standards to be insubstantial.[6/]

III

In granting Senco's motion to dismiss, Judge Taylor held that the source of the mixtures provision was the ACGIH document and concluded that the mandatory nature of the mixtures provision in section 1910.1000 represented a substantive change from the advisory nature of the cor-

---

6/ We reject the Secretary's argument that Senco may not challenge the procedural validity of an OSHA standard in an enforcement proceeding. In Rockwell International Corp., 81 OSAHRC 118/A2, 9 BNA OSHC 1092, 1980 CCH OSHD ¶ 24,979 (No. 12470, 1980), the Commission held that the employer can raise such a challenge. We adhere to that holding. See George C. Christopher & Sons, supra.

responding provision in the ACGIH document. However, we conclude that the source of section 1910.1000 was the Walsh-Healey standard, not the ACGIH document. See Chlorine Institute v. OSHA, 613 F.2d 120 (5th Cir. 1980). The May promulgation explicitly stated that the basis for the OSHA air contaminant standard was an earlier Walsh-Healey standard. See 36 Fed. Reg. 10523. In the explanation to the August repromulgation, OSHA did not say it was based on the Walsh-Healey Act, but the stated purpose was to clarify the earlier standard. Also, 29 C.F.R. § 1910.99 set forth the source standard for 1910.93 and continued to identify the source as 41 C.F.R. § 50-204.50. See 29 C.F.R. § 1910.1499. Therefore, the basis of the repromulgated standard remained the Walsh-Healey standard.

While it is clear that the Walsh-Healey standard is the basis of the current OSHA standard, it is less clear what the original Walsh-Healey standard contained. Senco argues that the OSHA standard is invalid because it contains a mixtures provision which is not explicitly contained in the Walsh-Healey standard.

The Walsh-Healey standard, section 50-204.50, provides:

> Exposures by inhalation, ingestion, skin absorption, or contact to any material or substance (i) at a concentration above those specified in the 'Threshold Limit Values of Airborne Contaminants for 1968' of the American Conference of Government Industrial Hygienists . . . shall be avoided.

The booklet, "Threshold Limit Values of Airborne Contaminants for 1968," contains several appendices, one of which contains a mixtures provision similar to the one contained in the OSHA standard. Essentially, Senco argues that when the Walsh-Healey standard and the original May 1971 OSHA standard referred to the ACGIH pamphlet, they incorporated only the body, and not the appendices of the pamphlet.

However, we conclude that the Walsh-Healey standard incorporated the mixtures provision. The Walsh-Healey standard incorporated "concentration[s] above those specified in the 'Threshold Limit Values of Airborne Contaminants for 1968." Accordingly, the Walsh-Healey standard incorporated any limits on airborne concentrations appearing anywhere in the ACGIH document. Logically, reference to the "concentrations" in the pamphlet would include the computation methods set forth in the appendix, including the mixtures provision that describes the method of calculating TLVs when confronted with the common problem of exposures to multiple air contaminants. In fact, the ACGIH Committee in the preamble to the 1968 ACGIH document refers to the mixtures provision as a method for "developing threshold limit values for mixtures." The ACGIH formula is commonly used to calculate the limits for mixtures, and the TLVs make little or no sense when applied to many real life industrial situations without the proper methods to calculate the TLVs of mixtures. 3 F.Patty, Industrial Hygiene and Toxicology, 235-6. Finally, throughout the introductory notes of the ACGIH pamphlet general reference is made to the appendices. This indicates that the appendices are an integral part of the pamphlet.

Assuming that the mixtures provision has been incorporated, Senco still contends that the standard is invalid because the language of the present standard's mixtures provision is mandatory while the mixtures provision in the source standard is merely advisory.

The Commission has found, in some instances, that changing advisory language to mandatory language is a substantive change. See Kennecott Copper Corp., 76 OSAHRC 81/A2, 4 BNA OSHC 1400, 1976-77 CCH OSHD

¶ 20,860 (No. 5958, 1976), aff'd, 577 F.2d 1113 (10th Cir. 1977). However, Senco's argument incorrectly assumes that the source of the OSHA standard is the ACGIH pamphlet. The source of the OSHA standard is the Walsh-Healey standard and both of these standards are mandatory. The Walsh-Healey standard states, "Exposures . . . to any material or substance . . . at a concentration above those specified in [the ACGIH document] . . . shall be avoided. . . ." (Emphasis added.) As the Fifth Circuit in Deering Milliken v. Marshall, 630 F.2d 1094 (5th Cir. 1980), observed:

> Whether the Threshold Limit Values mandated by Walsh-Healey were only advisory when originally established by the American Conference of Governmental Industrial Hygienists . . . is irrelevant; Walsh-Healey incorporated those values as mandatory exposure limits, and maintenance of their mandatory character through promulgation of section 1910.1000 was not a modification of the pre-existing Walsh-Healey standard.

630 F.2d at 1102.

The analysis that the court used in Deering Milliken v. Marshall, supra, applies to this case. The Walsh-Healey standard incorporated any concentrations included in the appendices of the pamphlet by reference. Just as the Walsh-Healey standard transformed the advisory TLVs to mandatory TLVs, the Walsh-Healey standard transformed the advisory ACGIH mixtures formula to a mandatory one. When the OSHA standard was promulgated with a mandatory mixtures formula, this was not a change from its Walsh-Healey source standard.

IV

The final question in this case is whether the OSHA standard is invalid because it does not include the explicit exception for non-additive substances found in the mixtures formula which was part of the Walsh-Healey standard. See note 4 supra.

For a period of two years following the effective date of the Act, the Secretary was authorized to summarily adopt established federal standards and national consensus standards as occupational safety and health standards. Section 6(a), 29 U.S.C. § 655(a). Any substantive modification of a source standard requires the use of the rulemaking procedures set forth in section 6(b). The original Walsh-Healey standard, by adopting the ACGIH and its appendices, allowed for exceptions from the general rule that substances are additive when "there is good reason to believe that the chief effects of the different substances are not in fact additive." Therefore, section 1910.1000(d)(2)(i), adopted under section 6(a), is unenforceable to the extent it modified the substantive requirements of its source standard by imposing on an employer a duty to treat all toxic substances as additive. See Diebold, Inc. v. Marshall, 586 F.2d 1327, 1332 & n.6 (6th Cir. 1978).

However, we are unable to determine on the record in this case whether Senco's substantive duties are in any way affected by the Secretary's deletion of the exception for nonadditive mixtures. See Market Street Railway Co. v. Railroad Comm., 324 U.S. 548, 562 (1945), cited in Daniel Int'l Corp. v. OSHRC, 656 F.2d 925, 930 & n.9 (4th Cir. 1981). Nothing in the record indicates whether methyl ethyl ketone, xylene and acetone are in fact additive or not additive. If the cited substances are nonadditive, the cited subsection may not validly be applied. However, if Senco's compliance responsibilities are not altered, the standard may be validly applied. Senco cannot profit from the Secretary's failure to adopt an exception to a standard's requirements when it could not claim benefit of the exception even if adopted.

Accordingly, the judge's order granting Senco's motion to dismiss is set aside. The case is remanded to the chief judge[7/] for further proceedings consistent with this opinion.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: OCT 29 1982

---

7/ Judge Taylor is no longer with the Commission.

ROWLAND, Chairman, dissenting:

I dissent from the majority's decision to remand this matter for further proceedings. In my view, the Walsh-Healey standard at 41 C.F.R. § 50-204.50, on which the OSHA standard now published at 29 C.F.R. § 1910.1000 is based, cannot reasonably be construed to include the mixtures provision appearing in the appendix to the ACGIH publication. Even assuming the Walsh-Healey standard can be so interpreted, the Secretary impermissibly changed the substance of the ACGIH mixtures provision by deleting language regarding non-additive substances when he promulgated the OSHA standard at issue in this case. Finally, the majority errs in concluding that despite the Secretary's deletion of that language, the standard is still enforceable as to substances which are additive, since that conclusion in effect rewrites the Secretary's standard.

As the majority notes, the Walsh-Healey standard prohibited exposure to "<u>any</u> material or substance" at a concentration in excess of that specified in the ACGIH publication. 41 C.F.R. § 50-204.50 (emphasis added). That standard, however, also prohibits exposures to concentrations above those set forth in two specifically designated tables, Table I and Table II. [1] The latter table is essentially the same as a listing entitled "Mineral Dusts" which appears in the ACGIH document and lists concentrations for certain silica compounds,

---

[1]The full text of 41 C.F.R. § 50-204.50(a)(1) as follows:

> Exposures by inhalation, ingestion, skin absorption, or contact to any material or substance (i) at a concentration above those specified in the "Threshold Limit Values of Airborne Contaminants for 1968 " of the American Conference of Govenmental Industrial Hygienists, except for the ANSI Standards listed in Table I of this section and except for the values of mineral dusts listed in Table II of this section, and (ii) concentrations above those specified in Tables I and II of this section, shall be avoided, or protective equipment shall be provided and used.

graphite, and nuisance particulates. [2]

As the majority opinion indicates, the mixtures provision as it appears in the ACGIH publication applies only to worksites having at least two toxic air contaminants and requires that the employer consider the cumulative rather than individual effect of those substances. That is, the mixtures provision is a special provision under which a hazard may exist even if the concentration of each substance involved does not exceed the level prescribed for that substance by the ACGIH. The Walsh-Healey standard, however, gives no indication that it is intended to include such situations. Rather, it expressly refers the employer only to the concentrations specified by the ACGIH. In my view, the reasonable employer who reads this language together with the standard's references to the concentrations for individual substances as enumerated in certain tables would conclude that the purpose of the standard is to protect employees from exposure to such substances at levels above those expressly prescribed in the ACGIH booklet. Furthermore, the standard states that the employer is required to prevent exposure to "any" material or substance above the concentration specified. In view of the absence of any mention of mixtures of more than one substance or of the posssible cumulative effect of mixtures, an employer could not reasonably be said to

---

[2]Table I has no counterpart in the ACGIH document.

understand that his duty extends to detecting and eliminating hazardous exposures to combinations of toxic substances when no substance individually exceeds the concentration prescribed by the ACGIH for that substance. As I have previously stated, standards cannot be construed to mean what the drafters might have intended but did not adequately express. Rather, employers must have fair notice of the obligations imposed by such standards. E.g., Bethlehem Steel Corp., 82 OSAHRC 19/C8, 10 BNA OSHC 1470, 1474, 1982 CCH OSHD ¶ 25,982 at 32,594 (No. 79-310, 1982) (concurring opinion).

The conclusion that the Walsh-Healey standard does not include the mixtures provision of the ACGIH publication is supported rather than weakened by the preamble to that publication on which the majority relies. Considering that the cumulative effects of mixtures of air contaminants may well have a significant effect on the health of employees, the ACGIH was aware that strict application of the threshold limit values prescribed for individual substances would not necessarily protect employees, and it so specifically stated. [3] Therefore, the Secretary was on notice that the ACGIH did not consider the concentrations otherwise specified to be adequate in the case of mixtures of more than one substance. The Secretary clearly had the opportunity to provide in the Walsh-Healey standard for the specific circumstances presented by mixtures of air contaminants as did the ACGIH, but failed to do so.

---

[3]According to the ACGIH preamble, "[s]pecial consideration should be given also to the application of [threshold limit] values in assessing the health hazards which may be associated with exposure to mixtures of two or more substances."

Finally, the subsequent history of the air contaminant standard suggests that even the Secretary had doubts as to whether he nad in fact adopted the mixtures provision under Walsh-Healey. As the majority observes, when the Secretary first promulgated an air contaminant standard under OSHA in May, 1971, he essentially used the language that appeared in the Walsh-Healey standard. Thus the original OSHA standard, like the Walsh-Healey standard, contained no references to mixtures of substances or to the cumulative effect of such mixtures. When the standard was repromulgated in its present form in August, 1971 its wording was extensively changed. The Secretary deleted any mention of the ACGIH publication and, for the first time, expressly included a mixtures provision. Since the Secretary largely abandoned the wording as it had appeared in the earlier OSHA standard and preceding Walsh-Healey standard, and since the changes were ostensibly to improve the "accuracy" of the OSHA standard, one could reasonably conclude that the Secretary's intention was to conform his standard more closely to the provisions of the ACGIH document. Accordingly, it would appear that the Secretary's adoption at this time of a mixtures provisions is an implicit recognition that when he had first sought to implement the ACGIH document in the Walsh-Healey standard he had not included the mixtures provision appearing therein. As the majority observes, the Secretary is not permitted under 29 U.S.C. § 655(a) to modify the substantive requirements of OSHA source standards.

In any event, regardless whether the mixtures provision of the

ACGIH publication may properly be considered to have been incorporated in the original Walsh-Healey standard, the Secretary's subsequent OSHA standard at issue in this case is invalid because it deletes language regarding the application of the mixtures provision to combinations of substances which do not have cumulative or additive effect. The deletion constitutes an impermissible substantive change in the language of the Secretary's source standard.[4]

As indicated above, the purpose of the mixtures provision as set forth in the ACGIH publication is to account for those situations in which, due to the additive or cumulative effect of several substances, strict application of the threshold limit values prescribed individually for those substances would not be adequate to protect employees. Accordingly, the ACGIH publication expressly provides that the mixtures formula is not to be applied to combinations of substances which do not in fact have an additive or cumulative effect. As the majority itself correctly concludes, the Secretary acted improperly in modifying his source standard so as to make the mixtures provision applicable to non-additive as well as additive situations.

The majority errs, however, in holding that the standard is nevertheless valid if the combination of substances involved in this case has an additive effect and in remanding for litigation of that

---

[4]In view of my conclusion that the standard is invalid for this reason, I need not consider as does the majority whether the standard is also invalid for the reason that the mixtures provision as it appeared in the ACGIH publication was only advisory rather than mandatory.

question. The standard as adopted by the Secretary [5] draws no distinction between additive and non-additive situations. Rather, it mandates application of the mixtures formula in all cases where different air contaminants exist in combination. The majority's action, therefore, requires that the parties litigate a matter which is not an element of the cited standard and to which that standard is not directed. [6] By so doing, the majority rewrites the Secretary's standard. The effect of their result in this case is to insert into the Secretary's standard a limitation on the use of the mixtures formula which the Secretary himself deleted from the ACGIH publication when he promulgated the OSHA standard at issue here. Such action, for the purpose of saving the Secretary's standard from invalidity, is clearly contrary to the Commission's function under the Act as an impartial adjudicator. The Commission does not have regulatory authority and is not empowered to write into standards provisions which the Secretary did not adopt. See Mobil Oil Corp., 82 OSAHRC , 10 BNA OSHC

---

[5]See note 1 of the lead opinion.

[6]The majority's reliance on Market Street Ry. v. Railroad Comm'n, 324 U.S. 548 (1945) is misplaced. As the court noted in Daniel Int'l Corp. v. OSHRC, 656 F.2d 925, 930 n.9 (4th Cir. 1981), that case concerned issues of procedural due process which did not substantially affect the rights of the parties. As I have explained above, in the case now before us the Secretary's deletion of language which had appeared in the ACGIH publication resulted in a substantial alteration of the employer's duty. As the court in Daniel itself recognized, substantive modifications in the requirements of source standards adopted as OSHA standards under 29 U.S.C. § 655(a) are inherently prejudicial because they effectively deny employers the right to comment on the standards. Id. at 930 & n.10.

1905, 1931-32, 1982 CCH OSHD ¶ 26,187 at 33,044-45 (No. 77-4386, 1982) (dissenting opinion); Shenango Co., 82 OSAHRC , 10 BNA OSHC 1613, 1982 CCH OSHD ¶ 26,051 (No. 78-4723, 1982) (dissenting opinion).

Since the Walsh-Healey source standard did not incorporate the ACGIH mixtures provision and since in any event the OSHA standard substantively modified the terms of the ACGIH provision, I would vacate the citation in this case.

| Respondent. | : | |

DECISION AND ORDER

Taylor, Judge:

This case involves an amended citation that alleges several serious violations. The parties have filed a settlement agreement as to items 1 and 2 of the citation. The settlement agreement filed on November 30, 1979, is approved.

Item 3 of the citation consists of three subitems. The gravamen of all the subitems is the exposure of respondent's employees to excessive levels of a mixture of air contaminants, that is, methyl ethyl ketone, xylene, and acetone. The health standard that governs whether there has been exposure to excessive levels of a mixture of air contaminants is presently codified at 29 C.F.R. § 1910.1000(d)(2)(i). The respondent has moved for a dismissal of item 3 on the basis that 29 C.F.R. § 1910.1000(d)(2)(i) was not properly promulgated. For reasons that follow, the respondent's motion is granted.

When initially promulgated under the Occupational Safety and Health Act of 1970, 29 U.S.C. § 651 et seq., the pertinent air contaminant standards were codified at 29 C.F.R. § 1910.93. 36 Fed. Reg. 10503 (May 29, 1971). As so promulgated, the standards did not contain a provision regarding a mixture of air contaminants. Subsequently, § 1910.93 was "revised in its entirety, in the interest of greater intelligibility and accuracy." 36 Fed. Reg. 15101 (August 13, 1971). The revision added the following requirement at 29 C.F.R. § 1910.93(d)(2)(i):

> In case of a mixture of air contaminants an employer shall compute the equivalent exposure as follows:
>
> $$E_m = \frac{C_1}{L_1} + \frac{C_2}{L_2} + \ldots \frac{C_n}{L_n}$$
>
> where:
>
> $E_m$ is the equivalent exposure for the mixture.
> C is the concentration of a particular contaminant.
> L is the exposure limit for that contaminant, from table G-1, G-2, or G-3.
>
> The value of $E_m$ shall not exceed unity (1).

36 Fed. Reg. 15102 (August 13, 1971). This standard was subsequently recodified as 29 C.F.R. § 1910.1000(d)(2)(i). 40 Fed. Reg. 23072 (May 28, 1975).

The initial promulgation of 29 C.F.R. § 1910.93 was under 29 U.S.C. § 655(a). Section 655(a) authorized the complainant, within a two-year period following the effective date of the Occupational Safety and Health Act of 1970, to adopt national consensus standards and establish

Federal standards as occupational safety and health standards without regard to the provisions in the Administrative Procedure Act, 5 U.S.C. § 553, for public participation in the rulemaking process. Otherwise, to promulgate a standard, the complainant is required to publish the proposed standard in the Federal register and to afford interested persons the opportunity to submit written objections thereto and to participate in a public hearing thereon. 29 U.S.C. § 655(b).

The source of 29 C.F.R. § 1910.1000(d)(2)(i) is the "Threshold Limit Values of Airborne Contaminants for 1970" of the American Conference of Governmental Industrial Hygienists (ACGIH). Appendix B of that publication provides that:

> When two or more hazardous substances are present, their combined effect, rather than that of either individually, should be given primary consideration. In the absence of information to the contrary, the effects of the different hazards should be considered as additive. That is, if the sum of the following fractions,
>
> $$\frac{C_1}{T_1} + \frac{C_2}{T_2} + \cdots \frac{C_n}{T_n}$$
>
> exceeds unity, then the threshold limit of the mixture should be considered as being exceeded. $C_1$ indicates the observed atmospheric concentration, and $T_1$ the corresponding threshold limit. . . .

> Exceptions to the above rule may be made when there is good reason to believe that the chief effects of the different harmful substances are not in fact additive, but independent as when purely local effects on different organs of the body are produced by the various components of the mixture. In such cases the threshold limit ordinarily is exceeded only when at least one member of the series $\left(\frac{C_1}{T_1} + \text{or} + \frac{C_2}{T_2} \text{ etc.}\right)$ itself has a value exceeding unity . . . . (Emphasis added.)

A comparison of this provision with 29 C.F.R. § 1910.1000(d)(2)(i) shows significant substantive differences. Not only does 29 C.F.R. § 1910.1000(d)(2)(i) completely omit the second paragraph of the ACGIH provision, but it transforms an advisory rule into a mandatory rule by the substitution of the word "shall" for the word "should" in two places. Since the complainant made these changes without following the rulemaking procedures provided in 29 U.S.C. § 655(b), 29 C.F.R. § 1910.1000(d)(2)(i) is invalid and unenforceable.[1/] Kennecott Copper Corp., 76 OSAHRC 81/A2 (No. 5958, 1976), aff'd, 577 F.2d 1113 (10th Cir. 1977).

---

1/ In his response to the respondent's motion, the complainant contends that the source standard is an "established Federal standard" published under the Walsh-Healy Act, 41 U.S.C. § 35 et seq. The standard referred to by the complainant, which was published at 41 C.F.R. § 50-204.50, does not contain a specific provision concerning a mixture of air contaminants. Except for some exceptions that are not pertinent here, that standard prohibited exposure to air contaminants "at a concentration above those specified in the 'Threshold Limit Values of Airborne Contaminants for 1968' of the American Conference of Governmental Industrial Hygienists." 34 Fed. Reg. 7953 (May 20, 1969). This quoted language is identical to

Relying on National Industrial Constructors, Inc., v. OSHRC, 583 F.2d 1048 (8th Cir. 1978), the complainant asserts that the respondent's "challenge to the procedural validity of the standard is not properly before the Commission" because 29 U.S.C. § 655(f) authorizes the raising of such claims only if they are presented to an appropriate United States court of appeals within 60 days after a standard has been promulgated. The portion of the National Industrial Constructors decision relied on by the complainant holds that construction safety standards promulgated under the Construction Safety Act,[2/] 40 U.S.C. § 333, were not invalid because they were not published in the Federal Register for at least 30 days prior to their effective date as required by the Administrative Procedure Act, 5 U.S.C. § 553.

---

1/ Footnote continued

that found in the original version of 29 C.F.R. § 1910.93(a) except that the year "1970" was substituted for the year "1968" in § 1910.93(a). Since the Walsh-Healy standard referred to by the complainant did not contain a specific provision regarding a mixture of air contaminants and since the August 13, 1971, revision of 29 C.F.R. § 1910.93 was made "in the interest of greater intelligibility and accuracy," as opposed to making significant substantive changes, the 1970 version of ACGIH publication, rather than the Walsh-Healy standard, must be the source of 29 C.F.R. § 1910.1000(d)(2)(i), unless the provisions in the 1968 and 1970 versions of the ACGIH publication did not differ significantly in substance. In the latter event, the basic issue and its resolution would not be affected.

2/ On the basis of being established Federal standards, these standards were subsequently promulgated as occupational safety and health standards under 29 U.S.C. § 655(a).

Whether the respondent's claim in this case has been properly characterized by the complainant as relating to the "procedural" validity of the standard need not be resolved. It is so abundantly clear that the situation in National Industrial Constructors differs in many respects from the situation in the instant case that the differences should not need to be spelled out in detail. Because the cases are so readily distinguishable, the National Industrial Contractors decision is not controlling here. See Marshall v. Pittsburgh-Des Moines Steel Co., 584 F.2d 638 (3d Cir. 1978); Kennecott Copper Corp., supra.

The complainant also contends that the respondent has not been prejudiced by the omission of the second paragraph of the ACGIH provision from 29 C.F.R. § 1910.1000(d)(2)(i) because the "Industrial Hygiene Field Operations Manual" published by the Occupational Safety and Health Administration (OSHA) contains a provision similar to the omitted paragraph and that the manual provision was considered before issuing the citation. In my opinion, that is not relevant since the standard is invalid because of the omission. The manual cannot breathe life into an invalid standard as it is only an internal administrative guide for OSHA and is not binding on the complainant or the Commission. See FMC Corp., 77 OSAHRC 153/D4 (No. 13155, 1977). Furthermore, even if the complainant's contention were meritorious, the standard is unenforceable because of changing the word "should" to the word "shall." Marshall v. Pittsburgh-Des Moines Steel Co., supra; Kennecott Copper Co, supra.

## Order

Item 3, Citation Number 1, is vacated. Pursuant to the settlement agreement, item 1, Citation Number 1, is vacated. Also pursuant to the settlement agreement, the violations alleged in item 2, Citation Number 1, are affirmed as nonserious violations, and a penalty of $50 is assessed for that item.

APPEARANCES:

Theodore J. Pethia, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of the Complainant.

Keith Ashmus, Esquire, Cleveland, Ohio, on behalf of the respondent.

Ken Carpenter, on behalf of intervening employees.

## DECISION AND ORDER

PATTON, Judge:

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651, et seq., 84 Stat. 1590, hereinafter referred to as the Act), contesting a citation issued by the complainant against the respondent under the authority vested in complainant by §9(a) of the Act.

The citation alleges that as a result of the inspection of a workplace under the ownership, operation and control of the respondent, located at Columbus, Ohio, the respondent has been charged with violating §5(a)(2) of the Occupational Safety and Health Act by failing to comply with Standard 29 C.F.R. 1910.132(a). It is alleged that in the freight handling areas, the employees that handled freight did not have adequate foot protection.

A hearing was held on November 14, 1980. Complainant and respondent appeared and presented evidence. Mr. Ken Carpenter, an employee of respondent, intervened on behalf of the affected employees.

## ISSUES IN THE CASE

It was alleged that the respondent violated Standard 29 C.F.R. 1910.132(a) in that respondent did not require employees handling freight to wear safety shoes. The respondent defends on the ground that jurisdiction is with the Federal Aviation Administration and that the Occupational Safety and Health Act, therefore, has no application. Respondent further defends on the ground that safety shoes are unnecessary. The intervening employees also oppose the wearing of additional foot protection.

## EVIDENCE AND EVALUATION OF CASE

The respondent is engaged in the business of transporting small freight ranging from less than two pounds in weight to 70 pounds. Approximately 120 employees are employed with approximately 110 of the employees handling packages at the site (TR 21). The packages are sorted by employees in a terminal and are conveyed by a conveyor belt. Other employees load the packages on and off of airplanes. Between 9,000 and 10,000 packages a night are handled (TR 26). Approximately 55% of the packages are what are known as "sky pack" packages. The sky pack packages weigh not over two pounds. Approximately 19% of the packages weigh more than five pounds (TR 192).

The packages are sorted and exchanged as they come off the plane and then are shipped out of Columbus, Ohio (TR 146-147). Approximately 96% of the employees are part time employees, primarily college students (TR 147-148). The respondent also employs on a part time basis, school teachers, bus drivers, policemen, firemen and other types of employees (TR 148). The employees are both men and women (TR 149). Part time employees in the terminal work from midnight to 3:00 a.m. and outside employees work from midnight to 3:30 a.m. (TR 145). The inside crew takes the freight from metal carts that come into the building following which it is put on a conveyor belt. Certain individuals who are

assigned to the sorting area remove the freight from the belt and sort it (TR 150). People that work outside are divided into four crews. They remove the freight from the aircraft and load the aircraft (TR 150). The pilot has the ultimate responsibility for supervising the loading (TR 151). Some of the packages weigh as much as 70 pounds (TR 24). The packages are picked up and placed in hampers outside the plane and employees on ground level receive them (TR 25). Some go directly into the hampers and some go to other employees to put in the hampers (TR 25).

Respondent is required to have a transportation manual which must be approved by the Federal Aviation Administration. The manual includes a page to "Columbus Airmeet Personnel". It reads as follows:

> "Appropriate Dress Code"
>
> Please be advised that beginning May 14, 1979, the following dress code will go into effect:
>
> 1. Proper footwear must be worn at all times. Sandals, thongs, clogs, or any type of open footwear that exposes any part of the foot are not acceptable.
>
> 2. Shorts, cutoff T-shirts, or any clothing that exposes midsection or legs are not acceptable.
>
> The purpose of this program is to eliminate human suffering. It is our desire to reduce to a minimum the accidents that could have been prevented."

It was undisputed that the respondent's employees did not wear safety shoes, it being the contention of respondent that they are unnecessary. The compliance officer testified that he saw some of the employees with canvas-type shoes (TR 34). It was stated that the packages were handled the same way outside the building as inside the building (TR 68). The sorters handle all sizes of packages. Some are metal, some are paper, cardboard, and wood (TR 119). The packages would jam and fall on the floor at times (TR 120). A person would have to have an area three or four feet to avoid them (TR 124). This was testified to by Mr. Robert

Thomas, a sorter at respondent's place of business. Mr. Kenneth L. Carpenter, a sorter, testified that the belt does not move at a high speed and the majority of the packages that fall off of it are light (TR 200). He said there are enough people to take care of the problem if a jam begins to develop and that they never have a real jam (TR 200). The heavy packages, according to Mr. Carpenter, do not fall off of the belt (TR 201). He said that at times they would have as much as fifty envelopes in a plastic bag. This bag might fall off but the plastic bag would be similar to a sleeping bag and he did not consider that a hazard (TR 201). He was of the opinion that safety shoes should not be required (TR 201). He said the heavy packages pushed the lighter ones off the belt and that a little envelope would not push a ten pound package off (TR 200). He has not seen anything heavier than a sky pack fall on anyone's feet (TR 205). He does not feel that the hazard of falling objects is any worse than if someone was shopping in a grocery store (TR 206).

The testimony was to the effect that safety shoes are not customarily worn in the industry (TR 166-167). They are not usually worn by United Parcel Service (TR 166-167). Gelco does not require employees to wear safety shoes (TR 175) and Mr. Robert Owen, Vice-President and Director of Safety for respondent testified that he knew of no small package handling system that had such requirements (TR 175). He stated that Eastern Airlines and TransWorld Airlines do not require it (TR 176).

Mr. Fredrick Graff, industrial engineering manager of respondent, explained the differences in United Parcel Service and the respondent's business. He said they were similar in that there was a large volume of packages coming in by aircraft, that the packages are brought into a building where they are sorted to various destinations and then sent back out again by tractor trailers. He testified, however, that that there were differences. The Purolator's handling of the freight

was much simpler so far as the conveyance system was concerned. The Purolator system was a single level conveyor system and United Parcel had a multi-conveyor system which handled 50,000 to 100,000 packages per night. He said at United Parcel, some of the conveyors would be 20 feet high and if something fell off a conveyor, it might fall 20 feet before it hit something (TR 164). The height of the conveyor at the respondent's terminal was 32 inches (TR 165). The percentage of sky packs and envelopes in respondent's business is significantly higher than in United Parcel. United Parcel's volume of sky pack and envelope size freight was approximately 20% whereas it was around 50% for respondent (TR 165). United Parcel Service, however, had a maximum of 50 pounds whereas respondent's maximum was 70 pounds. United Parcel's heavier packages were primarily heavy iron and steel packages with such things as plow blades, gas tanks for cars, and paint cans. They also handle tires (TR 165). He did not observe these particular types of freight in respondent's business (TR 165-167). The freight at United Parcel Service is generally segregated with the heavier articles in a designated area. A man running a tram, which is a type of train, would take the packages and place them in a trowl and wheel them to the outbound location. These packages would not be placed on the conveyor system but would be handled separately by a designated individual (TR 166). There is no person at respondent's terminal who is assigned to handle this type package (TR 166). It was testified that at the present time United Parcel Service requires safety shoes only for a tram operator at the St. Louis terminal (TR 167). This employee handles iron and steel (TR 167).

It was testified that by Mr. Maglicic, the compliance officer, that an employee could have a smashed toe if wearing leather shoes (TR 79). He testified that a ten pound weight falling 2 1/2 feet in an area three inches by one-half inch, would be the equivalent of 2880 pounds, 4 feet - 3840 pounds (TR 80). A seven

pound package would be the equivalent to 2,016 pounds if dropped from three feet (TR 81).

Mr. Owens testified that he does not say that no heavy packages fall off but a greater percentage of those falling off are light (TR 183). Mr. Richard Greismer, an employee of respondent, testified that most of the things that fall off of the conveyor belt are very light packages (TR 138).

Mr. Greismer testified that when he was wearing cowboy boots, a toebar connecting the baggage cart to a motorized vehicle fell down onto his boot. He stated that it fell, as best as he could recall, from knee height (TR 133-135). He continued to work the rest of the shift and his ability to walk was not impaired (TR 136). He stated that the cart is no longer used (TR 136). The hitches on the front of the carts now are stationery and do not move and he could not be exposed to this type of injury now (TR 136-137).

Mr. Richard Leece, a former employee of respondent, stated that a cannister weighing approximately 40 pounds fell on the bridge of his foot (TR 142). The foot was injured. Steel-toed shoes would not have prevented this injury as it was not the toes which was struck (TR 143, 154). Employee James Rice, a sorter-loader, (Exhibit C-6), injured the large toe of his left foot when a package he was handling while unloading an aircraft slipped from his hands, falling on his left foot, causing him to lose five work days. He was not working on the conveyor belt but was engaged in unloading operations. Sorter-loader Roland A. Dike, while unloading an aircraft, injured his right foot. The bottom of a box containing a 50 pound motor gave way and fell on his foot, causing injury to the toe (Exhibits C-8 and C-11). The respondent testified that a repetition of this injury would be unlikely because the respondent requested its customers to meet DOT regulations for packaging (TR 152).

The first issue for determination is whether the Occupational Safety and Health Act applies to the respondent's operations. §4(b)(1) of the Occupational Safety and Health Act provides that if another federal agency has legal jurisdiction and exercises that jurisdiction, the Occupational Safety and Health Administration is without jurisdiction. It is the contention of the respondent that the Federal Aviation Administration has jurisdiction in this case.

The Federal Aviation Administration requires the respondent to have a manual which must be approved by said agency. The manual of respondent incorporates a page dealing with clothing including the type of shoes which must be worn. This requirement for a manual to be kept is found in the Federal Register, Regulation 14 C.F.R. §121.133. Said regulation states the manual must be provided for the guidance of "ground operations" as well as certain other operations of a company so regulated.

Regulation 14 C.F.R. 121.135(a) reads as follows:

> "Each manual required by §121.133 must . . . . (1) include instructions and information necessary to allow the personnel concerned to perform their duties and responsibilities with a high degree of safety."

The respondent cites the case of Northwest Airlines, Inc. _____ OSAHRC _____, 8 BNA OSHC 1982, _____CCH OSHD ¶_____ (No. 13649, Sept. 3, 1980). In that case the Occupational Safety and Health Review Commission stated that the requirement for a manual which must be approved by said agency constituted an exercising of authority and therefore, the mechanics who serviced and repaired the airplanes were within the jurisdiction of the Federal Aviation Administration and the Occupational Safety and Health Administration was ousted from jurisdiction.

The employees involved in the Northwest Airlines, Inc., supra, had a more direct relationship to flight than do the employees in the case at bar. The mechanics who keep an airplane in such condition as to make it possible for the plane to safely fly, are an integral part of flight itself. On the other hand,

employees who sort freight and load and unload freight are not as directly related to flight. The Federal Aviation Administration in regulations 14 C.F.R. 61-67, sets forth various types of employees who the agency must certify for their positions. Mechanics are included but baggage handlers are not. No authority has been cited by counsel for any party in the proceeding which definitely determines whether employees loading and unloading planes or sorting freight would come under the "ground operations". This judge has found no decision expressly determining the point. It would appear, however, that the certification by the Federal Aviation Administration of certain employees and not of other employees constitutes an affirmance of jurisdiction only over the employees certified. It has not been established that the Federal Aviation Administration exercises authority over employees engaged in the work of the employees involved in the case at bar and therefore, the Occupational Safety and Health Act applies to said operations. In view of this fact, the position of the respondent that the Occupational Safety and Health Act does not apply because of §4(b)(1) of the Act is without merit and must be overruled.

The cited standard, 29 C.F.R. 1910.132(a) reads as follows:

> "Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices and protective shields and barriers shall be provided, used, and maintained in a sanitary and reliable condition whenever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact."

It will be observed that said standard does not specifically require safety shoes in an industry such as that of respondent but such equipment would be required "whenever it is necessary by reason of hazards of processes or environment, etc." The test is whether it is "necessary by reason of hazards of

processes". It is the position of the respondent that the accident frequency is so slight as compared to the total number of man hours worked and total number of packages handled that safety shoes should not be required. Respondent further points out that the great majority of the packages handled are of a small nature weighing very few pounds and that those that generally fall off of the conveyor belt are only those weighing two pounds or less.

The respondent takes the position that those few instances in which there had been injuries represented problems which no longer existed. The hand baggage cart now has a stationery tongue, the weight of packages has been reduced from 90 to 70 pounds, and improper packaging has been forbidden. The change in the tongue of the cart would alleviate the possibility of an injury resulting from the tongue falling. The caution to customers to properly package their freight does not, however, insure that in all instances, the instructions of the respondent will be carried out. The reduction in weight from 90 to 70 pounds still leaves sufficient weight to cause substantial injury to a foot if an article fell on it and, therefore, it cannot be said that this weight reduction amounts to more than a slight mitigation of the hazard.

The respondent further points out that there is a substantial turnover of its employees, with the average time worked probably not being over two and a half months and that it would be a substantial burden on the employees to purchase shoes for such a short period of employment. The respondent also takes the position that because of the rapid turnover, it would constitute substantial burden on the respondent if the respondent, itself, had to buy the shoes each time an employee was employed.

The case of United Parcel Service of Ohio v. Occupational Safety and Health Review Commission, 570 F.2d 806 (8th Cir. 1978) was very similar on its facts to the case involved. The United Parcel Service is engaged in the business of

receiving, handling, transporting and delivering in interstate commerce parcels and packages of up to 50 pounds in weight and having maximum outside dimensions of 108 inches. It maintains a number of establishments throughout the country at which establishments, parcels are loaded in trucks, unloaded, sorted and dispatched for ultimate delivery in smaller trucks to the consignees of the packages. Three hundred and seventy five employees are classified as unloaders and sorters and they physically unload and sort the packages received at the facility. Of the 375 people employed in this work, only 10 worked at full shifts. These 10 spent 1/2 of a workday unloading parcels from trucks and the other half washing vehicles. The other 365 unloaders and sorters worked only a few hours each day. Many of them were young people attending college, trade schools, or high schools. The employment turnover among unloaders and sorters was extremely high. About 40% quit within the first 30 days of their employment and 50% or more quit within six months. The United Parcel Service handled an average of 175,000 to 200,000 parcels a day at the terminal in question. 60% of the parcels weighed 10 pounds or less and only 15% weighed more than 25 pounds. The parcels were removed from the trucks by the unloaders and placed on large conveyor belts which moved them into the interior of the facility where the sorters removed the parcels from the conveyor belts and placed them on smaller belts which conveyed them to various departments. Some of the smaller belts were above the head of the sorters. Parcels had a tendency to pile up on the belts and might fall from them.

In said case, 9 employees sustained job injuries over an 18 month period of time.

The administrative law judge held that a violation had been established and the Occupational Safety and Health Review Commission refused to grant administrative review. The case was thereupon appealed to the Court of Appeals for the 8th Circuit.

The Court held a violation had been established but the requirement of abatement that all employees handling said freight must wear safety shoes was an overly broad abatement requirement. The Court stated:

> "Upon reconsideration, the Commission may conclude that substantial workshoes, other than steel-toed shoes, may suffice to protect adequately the feet and toes of all the unloaders and sorters, or it may conclude that some of those employees need to wear steel-toed shoes whereas others do not. Or, the Commission may decide to direct its requirements at the hazard that has been described rather than to a protection of workers from the hazard."

The case was remanded for further consideration by the Review Commission.

It will be observed that the facts are substantially similar to the case now before this judge. In the United Parcel Service case, some of the conveyance belts were at a higher elevation than those of respondent in this case. There was also a somewhat higher percentage of heavier packages handled although the maximum weight was only 50 pounds whereas it is 70 pounds for the respondent.

The case at bar does not arise within the jurisdiction of the Court of Appeals for the 8th Circuit and, therefore, said case while persuasive, is not binding in this case. While it is true as contended by the respondent that the large majority of the freight is of a small and light nature, approximately 9% of the freight is over 10 pounds and some of the freight is as much as 70 pounds. With the very small number of injuries in comparison to the amount of freight handled, it becomes a close question as to whether a reasonable prudent man would be put on notice that the condition was such as to require the wearing of safety shoes. It will be observed, however, that while the number of injuries in the cases of Ryder Truck Lines, Inc. v. Brennon, 497 F.2d 230 (5th Cir. 1974); MacLane Trucking Company v. OSHRC, 503 F.2d (4th Cir. 1974) and the case of United Parcel Service, supra, was greater than in the case at bar, the percentage of injuries as compared to the amount of freight handled was in all of said cases extremely small. In all of said cases a violation was found notwithstanding the infrequency of injury. While it is

true that there was slightly more danger established in the United Parcel Service case than in the case of respondent, the difference is very slight and the facts are remarkably similar. The fact that a large majority of the packages are light does not alter the fact that heavy packages which could injure feet are handled. In the United Parcel case, both the Review Commission and the United States Court of Appeals for the 8th Circuit found that a violation had been established.

The Court of Appeals for the 8th Circuit did disapprove the remedy of the Review Commission in the light of the facts of that case. It was found there, as the evidence establishes in this case, that the cost of safety shoes is substantial. Testimony in the case at bar was that the cost was in excess of $50 per pair of shoes. In both cases there was a constant turnover of employees which would make the necessity of buying shoes, either by the employees or by the respondent, a rather substantial item. In the United Parcel Service case, the employees who handle the heavy objects were different employees than those who handled most of the smaller objects. That situation led itself to a remedy which would require the wearing of safety shoes only by those employees handling heavy parcels. If most of the employees, as in that case, handled only very light parcels, there would be no need for safety shoes for such employees. Unfortunately, in the case at bar, the evidence establishes that all of the employees involved in this case handled parcels of all sizes. It is therefore impossible in a remedy to designate certain employees as those required to wear safety shoes and to hold that safety shoes need not be worn by other employees.

The compliance officer testified that toe plates which could be inserted over the toes of normal shoes would be acceptable. Toe plates would not be as complete a protection as metal toed shoes but would certainly be a greater protection than no metal protection at all. The problem pointed out by the respondent that the expense would be substantial because shoes would have to be constantly purchased

as a result of the constant change of employees would be alleviated if toe plates were used in lieu of safety shoes. The toe plates could be reused, being slipped over the toes of shoes of first one employee and then another. In its brief, the respondent points out that a number of its employees are women. The record does not establish whether toe plates are available on womens shoes. It would appear however, that a woman's flat heel shoe built somewhat similar to a man, is available and that the toe plates could be used over such shoes. The shoes upon which the toe plates are placed should be substantial leather shoes.

In view of the substantial expense, due to employee turnover, if safety shoes are required, and the small number of accidents per man hour worked, safety shoes will not be required. The handling of packages up to 70 pounds in weight does, however, constitute some hazard to the employee's feet and therefore, toe plates will be required.

The violation would appear to be a non-serious violation and therefore, no penalty will be assessed.

## FINDINGS OF FACT

1. Respondent is engaged in the business of interstate transportation by air of articles of freight weighing between two pounds and 70 pounds.

2. Over 50% of articles of freight handled by respondent weigh two pounds or less. Nineteen percent weigh in excess of five pounds and 9% weigh in excess of 10 pounds. The maximum weight of articles handled is 70 pounds.

3. The respondent's employees are engaged in taking freight on and off of airplanes and sorting the freight in the respondent's terminal.

4. The freight is placed on a conveyor belt in the respondent's terminal and at times, will fall from the conveyor belt.

5. The conveyor belt is 32" high.

6. The great majority of the packages falling from the conveyor belt are of a light nature although some heavy packages fall from the conveyor belt.

7. There have been only three or four injuries to employees feet from falling objects over a period of several years.

8. The Federal Aviation Administration does not exercise jurisdiction over employees loading and unloading airplanes or sorting freight to be transported on airplanes.

9. The respondent's employees do not wear safety shoes nor shoes which are covered by metal toe plates.

10. The transportation manual of respondent prohibits said employees from wearing sandals, thongs, clogs or any type of open footwear that exposes any part of the foot.

11. The failure to wear metal protection over the toes of said employees constitutes some hazard of foot injury which should have been recognized by respondent.

12. Either safety shoes or toe plates over shoes would constitute a substantial additional protection to the employees toes against falling objects.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting interstate commerce and is within the jurisdiction of the Occupational Safety and Health Act.

2. The Federal Aviation Administration does not exercise jurisdiction over the employees involved in this case and the Occupational Safety and Health Act therefore applies.

3. The respondent was, on or about February 27 and 28, 1980, in violation of Standard 29 C.F.R. 1910.132(a) by failing to require its employees to wear either safety shoes or toe plates over leather shoes.

## ORDER

It is therefore ordered that:

Respondent was, on or about February 27 and 28, 1980, in non-serious violation of Standard 29 C.F.R. 1910.132(a) in that its employees handling and sorting freight did not have adequate foot protection.

The respondent is not ordered to require its employees to wear safety shoes but is ordered to, within 30 days of the date this decision becomes a final order, require its employees handling freight to wear toe plates over leather shoes. No penalty is assessed.

Dated this 6th day of April, 1981.

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>CARL M. GEUPEL CONSTRUCTION CO.,<br>Respondent. | OSHRC Docket Nos. 81-55 & 81-56 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case is before us on interlocutory appeal from a decision of Judge George O. Taylor. The Carl M. Geupel Construction Co. ("Geupel") contends that Judge Taylor erroneously denied its motion to suppress evidence obtained by the Occupational Safety and Health Administration ("OSHA") in an inspection of Geupel's highway construction site on the West Virginia Turnpike.

I.

On August 8, 1980, compliance officers from OSHA arrived at Geupel's worksite after receiving an employee's complaint concerning certain allegedly hazardous conditions. 1/ Geupel denied their entry. On October 7, 1980, OSHA applied in the United States District Court for the Southern District of West

---

1/ The employee's complaint asserted the following:

1. No back-up alarms on Mack dump truck;
2. Excessive dust and insufficient use of water trucks;
3. Operation of trucks within three feet of loaded and primed holes;
4. Operation of two-way radios in proximity to loaded holes;
5. Improper transportation of explosives.

Virginia, on an ex parte basis, for a warrant to inspect Geupel's entire worksite. A warrant to inspect the entire worksite was granted on October 14, 1980. Following OSHA's inspection, Geupel was issued citations alleging several serious and other-than-serious violations of various safety and health standards.

After assignment of these cases to Judge George O. Taylor, Jr., Geupel moved to suppress the evidence obtained in the inspection and to vacate the citations. As grounds for its suppression motion, Geupel asserted that OSHA's warrant was invalid because the regulation that authorized OSHA to obtain an ex parte warrant was promulgated improperly. Geupel also contended that the scope of OSHA's inspection was overbroad because it was not limited to the conditions described in the employee's complaint.

On April 3, 1981, Judge Taylor denied Geupel's motion to suppress the evidence and vacate the citations. The judge concluded that OSHA's 1978 amendment to its inspection regulations to define "compulsory process" as including ex parte warrants was interpretive and, thus, its adoption without notice and comment was proper. The judge also concluded that OSHA's inspection was not overbroad. He reasoned that "a general inspection of a worksite is permissible when a warrant application establishes a reasonable belief that hazardous conditions may exist as to specific operations conducted at a worksite." According to the judge, a contrary conclusion would frustrate the purpose of the Act.

II.

Geupel then petitioned the Commission for interlocutory appeal of the judge's decision. On May 14, 1981, the Commission granted its petition and remanded this case to the judge for reconsideration in light of Sarasota Concrete Co., 81 OSAHRC 48/A2, 9 BNA OSHC 1608, 1981 CCH OSHD ¶ 25,360 (No.

78-5264, April 27, 1981), appeal filed, No. 81-5621 (5th Cir. June 23, 1981). In Sarasota Concrete, the Commission adopted the position that, when probable cause for an inspection is based solely on specific evidence of an existing violation, to accommodate the fourth amendment the inspection generally should be limited to the alleged violative condition. The Commission also held that, when a warrant is not tailored to the showing of probable cause, evidence obtained thereby that is not supported by probable cause would be excluded from the record. In determining whether to apply the exclusionary rule, the Commission further held that the ultimate issue is not whether the Secretary proceeded in good faith in obtaining the evidence in question but rather whether the evidence was lawfully obtained under the fourth amendment. In Sarasota Concrete, the Commission was not confronted with a situation where violations other than those alleged in the employee's complaint were in plain view and thus did not address the issues arising out of such a situation.

After reconsidering his prior decision in light of Sarasota Concrete, the judge "vacated" that part of the decision upholding the validity of OSHA's warrant authorizing an inspection of Geupel's entire worksite based on specific evidence of five allegedly violative conditions. The judge otherwise adhered to his prior decision in which he denied Geupel's suppression motion. Citing United States v. Peltier, 422 U.S. 531 (1975), the judge reasoned that Sarasota Concrete should not be applied retroactively to suppress evidence obtained in good faith in an inspection that occurred before the scope limitation of Sarasota Concrete was announced. The judge noted that federal courts were sharply divided on whether an employee complaint concerning specific conditions constituted probable cause for a wide-ranging inspection of a worksite. In the judge's view, retroactive application of the exclusionary rule would not further the rule's deterrent effect.

III.

Geupel petitioned the Commission for interlocutory appeal of the judge's reconsidered decision. This petition was granted and is now before us for resolution. On review, Geupel argues that the judge misapplied Sarasota Concrete by failing to give effect to the scope limitation announced in that decision. Geupel further contends that the judge erred in failing to apply the exclusionary rule based on the good faith of OSHA's compliance officers, since the Commission in Sarasota Concrete rejected the argument that good faith precludes the application of the exclusionary rule. Geupel contends that retroactive application of the exclusionary rule would be consistent with Supreme Court precedent and appropriate in this case because: (1) the Commission's decision in Sarasota Concrete was not a "sharp break" with prior authority as that term has been defined by the Court, and (2) the Court has held that the exclusionary rule will be applied to exclude evidence in all cases not yet final, even though the evidence was obtained in good faith reliance on constitutional standards then applicable. Geupel also argues the inspection was invalid because the regulation under which OSHA obtained its ex parte warrant was improperly promulgated.

The Secretary contends that the exclusionary rule should not be applied retroactively to suppress evidence obtained where a warrant, based on an employee's complaint, had been executed prior to issuance of a decision in Sarasota Concrete, because: (1) the exclusionary rule's purpose--deterrence of unlawful conduct--would not be furthered, and (2) the Commission's decision in Sarasota Concrete was a "sharp break" with prior precedent upon which the Secretary relied in good faith in seeking and obtaining a full-scope warrant. In any event, the Secretary contends that suppression of all of the evidence would not be appropriate since at least one item for which Geupel was cited was

specified in the employee's complaint. Finally, the Secretary argues that evidence relating to the other items may be admissible under other theories -- employee complaints were so pervasive as to justify a full-scope warrant, the Secretary was required to conduct an investigation to determine the location of the alleged violations, violations other than those complained of were in plain view, or the company has no reasonable expectation of privacy in that its activities were conducted in the "open fields." 2/

IV.

The primary issue to be decided is whether the judge erred in declining to retroactively apply the exclusionary rule of Sarasota Concrete in this case. 3/ We conclude that he did. Under Sarasota Concrete, the "ultimate issue" is not the Secretary's good faith, as the judge found, but whether the evidence was legally obtained under the fourth amendment. As the Commission held in Sarasota Concrete, evidence is not insulated from operation of the exclusionary rule if probable cause is found lacking, even though the Secretary proceeded in good faith in obtaining it. 4/

---

2/ The Secretary also contends that the Commission erred in Sarasota Concrete in holding the exclusionary rule applicable to Commission proceedings. We reject this argument for the reasons given in Sarasota Concrete. The Secretary additionally argues that the Commission does not have authority to review a judicial officer's issuance of a warrant. This argument was rejected by the Commission in Sarasota Concrete, supra, and in Davis Metal Stamping, Inc., 82 OSAHRC 37/A2, 10 BNA OSHC 1741, 1982 CCH OSHD ¶ 26,134 (No. 78-5775, 1982).

3/ Geupel's argument that the warrant is invalid because it was issued ex parte was rejected by the Commission in Roberts Consolidated Indus., Inc., 82 OSAHRC 38/A2, 10 BNA OSHC 1761, 1982 CCH OSHD ¶ 26,135 (No. 78-5775, 1982).

4/ A similar "good faith" argument against retroactive application of the fourth amendment exclusionary rule was recently rejected by the Supreme Court in United States v. Johnson, 102 S.Ct. 2579, 2592-2593 (1982).

We likewise reject the Secretary's argument that application of the exclusionary rule in this case would not further the purpose of the rule, i.e. deterrence of further unlawful conduct. In Sarasota Concrete, the Commission noted that the potential deterrent effect inherent in applying the exclusionary rule outweighs the adverse effect on enforcement and that exclusion of evidence under the rule is the most practical remedy in our proceedings. We adhere to this view.

Indeed, the Commission's position in Sarasota Concrete, as reaffirmed in this decision, finds ample support in the recent Supreme Court decision in United States v. Johnson, 102 S.Ct. 2579 (1982). In that case, the Court stated:

> If, as the Government argues, all rulings resolving unsettled Fourth Amendment questions should be nonretroactive, then, in close cases, law enforcement officials would have little incentive to err on the side of constitutional behavior. Official awareness of the dubious constitutionality of a practice would be counterbalanced by official certainty that, so long as the Fourth Amendment law in the area remained unsettled, evidence obtained through the questionable practice would be excluded only in the one case definitively resolving the unsettled question. Failure to accord any retroactive effect to Fourth Amendment rulings would "encourage police or other courts to disregard the plain purport of our decisions and to adopt a let's-wait-until-it's-decided approach." Desist v. United States, 394 U.S., at 277 (Fortas, J., dissenting).

102 S.Ct. at 2593-2594 (footnote and citation omitted; emphasis in original).

The Secretary also argues that Sarasota Concrete constituted a "sharp break" with prior precedent on which he had relied, and thus retroactive application of it should be precluded. We disagree. As stated by the Court in United States v. Johnson, a decision does not constitute a sharp break:

> [U]nless that ruling caused "such an abrupt and fundamental shift in doctrine as to constitute an entirely new rule which in effect replaced an older one,".... Such a break has been recognized only when a decision explicitly overrules a past precedent of this Court,...or disapproves a practice this Court arguably has sanctioned in prior cases,...or overturns a longstanding and widespread practice

> to which this Court has not spoken, but which a near-unanimous body of lower court authority has expressly approved.

102 S.Ct. at 2588 (citations omitted). Prior to the Commission's decision in Sarasota Concrete, the decisions of appellate and district courts were divided as to whether the scope of an inspection must be limited to the conditions described in an employee's complaint. 5/ Thus, there was not a "near unanimous body of lower court authority" on the issue of scope of an inspection from which Sarasota Concrete constituted a sharp break. Similarly, as the Commission noted in Sarasota Concrete, the courts at that time were divided on the application of the exclusionary rule to OSHA cases. 6/ Moreover, the Commission had used the exclusion of evidence as a sanction against governmental misconduct prior to Sarasota Concrete, albeit in a different context. Metropak Containers Corp., 80 OSAHRC 98/C13, 8 BNA OSHC 2112, 1980 CCH OSHD ¶ 24,813 (No. 77-3861, 1980) (violation of protective order). Thus, Sarasota Concrete also was not a sharp break on the issue of application of the exclusionary rule. For these reasons,

---

5/ Compare North American Car Co. v. Marshall, 626 F.2d 320 (3d Cir. 1980) (inspection must bear reasonable relationship to violations alleged in employee's complaint); Marshall v. Trinity Indus., Inc., 7 BNA OSHC 1851, 1979 CCH OSHD ¶ 23,943 (W.D. Okla. 1979) (inspection must be limited to areas complained of); and Whittaker Corp. v. OSHA, 6 BNA OSHC 1492 (M.D. Pa. 1978) (same); with Marshall v. Berwick Forge & Fabricating Co., 474 F.Supp. 104 (M.D. Pa. 1979) (broad scope inspection approved); and In re Seaward Int'l, Inc., 510 F.Supp. 314 (W.D. Va. 1980) (same), aff'd, 644 F.2d 880 (4th Cir. 1981). Cf. Burkart Randall Div. of Textron, Inc. v. Marshall, 625 F.2d 1313, 1323 (7th Cir. 1980) (collecting cases) (broad scope inspection approved).

6/ Compare Todd Shipyards Corp. v. Secretary of Labor, 586 F.2d 683 (9th Cir. 1978) (suggesting exclusionary rule not applicable to OSHA proceedings) with Savina Home Indus., Inc. v. Secretary of Labor, 594 F.2d 1358 (10th Cir. 1979) (indicating exclusionary rule applicable); see also In re Inspection of Central Mine Equipment Co., 7 BNA OSHC 1185, 1979 CCH OSHD ¶ 23,309 (E.D. Mo. 1978) (suppressing evidence obtained outside proper scope of OSHA inspection), rev'd on other grounds, 608 F.2d 719 (8th Cir. 1979); Weyerhaeuser Co. v. Marshall, 6 BNA OSHC 1811, 1978 CCH OSHD ¶ 22,900 (E.D. Wis. 1978) (suppressing evidence obtained in OSHA inspection), aff'd, 592 F.2d 373 (7th Cir. 1979).

we find that the judge's refusal to apply Sarasota Concrete to this case was in error. 7/

V.

Since the judge held Sarasota Concrete inapplicable in this case, he did not consider arguments concerning whether probable cause existed for the specific evidence the Secretary wished to introduce below. Thus, in applying Sarasota Concrete on remand the judge must determine: (1) what, if any, part of the inspection was supported by probable cause in light of the criteria contained in Sarasota Concrete; (2) the merits of the Secretary's "plain view" argument; 8/ and, (3) what, if any, evidence should be suppressed.

---

7/ Although in United States v. Johnson, the Court set forth definitive rules governing when a decision construing the fourth amendment is to be applied retroactively, it also noted that questions of civil retroactivity continue to be governed by Chevron Oil Co. v. Huson, 404 U.S. 97 (1971) ("Chevron"). As the case before us concerns the retroactive application of a fourth amendment decision, we have been guided by United States v. Johnson. However, we conclude that application of the criteria for retroactivity articulated in Chevron would yield the same result.

8/ On the issue of "plain view," see Ackermann Enterprises, Inc., 82 OSAHRC 29/A2, 10 BNA OSHC 1709, 1982 CCH OSHD ¶ 26,090 (No. 80-4971, 1982). In that case the Commission held that, when a compliance officer is granted permission to be in a particular area, his observation of objects in plain view from that area is not a constitutional violation.

Accordingly, we reverse the judge's holding with respect to the retroactive application of the exclusionary rule and remand this case 9/ for further proceedings consistent with this decision. 10/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
Executive Secretary

DATED: OCT 29 1982

---

9/ Based on his separate views stated in Roberts Consolidated Indus. Inc., 82 OSAHRC 38/A2, 10 BNA OSHC 1761, 1763 n.5, 1982 CCH OSHD ¶ 26,135 at pp. 32,906-32,907 n. 5 (No. 78-5775, 1982), Chairman Rowland would find that OSHA's inspection of Geupel's worksite was invalid and vacate the Secretary's citation. However, although Chairman Rowland does not join in the Commission's order of remand in this case, he does agree that Sarasota Concrete's exclusionary rule is entitled to retroactive application.

10/ We remand this case to the Chief Administrative Law Judge for assignment since Judge Taylor is no longer employed by the Commission.

COTTINE, Commissioner, concurring:

On May 14, 1981, the Commission remanded this case to the administrative law judge for reconsideration in light of the Commission decision in Sarasota Concrete Co., 81 OSAHRC 48/A2, 9 BNA OSHC 1608, 1981 CCH OSHD ¶25,360 (No. 78-5264, 1981), appeal filed, No. 81-5621 (5th Cir. June 23, 1981). In view of this specific direction by the Commission, the judge was without authority to deny retroactive application of Sarasota Concrete Co.. See United States v. Impson, 535 F.2d 286 (5th Cir. 1976); see also Chapman v. United States, 547 F.2d 1240, 1246-47 (5th Cir. 1972). Accordingly, I concur in the Commission remand of this case for application of Sarasota Concrete Co., for a determination on the remaining issues relevant to the Respondent's suppression motion,[1/] and for appropriate further proceedings.

However, my colleagues err in concluding that the holding of United States v. Johnson, 102 S.Ct. 2579 (1982), regarding the retroactive application to criminal enforcement proceedings of decisions construing the Fourth Amendment, is controlling in this administrative proceeding. In United States v. Johnson the Court expressly stated,

> all questions of civil retroactivity continue to be governed by the standard enunciated in Chevron Oil Co. v. Huson, 404 U.S. 97, 106-107 (1970).

102 S.Ct. at 2594-95. Although Fourth Amendment prohibitions apply to

---

1/ The Commission does not directly review the validity of a magistrate's warrant but undertakes a de novo inquiry to determine the existence of probable cause for an inspection and whether to use all or part of the evidence obtained. Sarasota Concrete Co., supra; see Babcock & Wilcox Co. v. Marshall & OSHRC, 610 F.2d 1128 (3d Cir. 1979); cf. United States v. Christine, No. 81-2077 (3d Cir. Aug. 30, 1982)(It is appropriate to sever the invalid portions of a warrant and suppress illegally seized evidence while leaving the valid portions of a warrant intact and legally seized evidence admissible.); United States v. Cook, 657 F.2d 730 (5th Cir. 1981)(same).

civil as well as criminal investigations, Marshall v. Barlow's, Inc., 436 U.S. 307 (1978); See v. City of Seattle, 387 U.S. 541 (1967), the Fourth Amendment standards governing these investigations differ. Marshall v. Barlows, Inc., supra; United States v. Robson, 477 F.2d 13, 19 (9th Cir. 1973). Proceedings before the Commission are civil in nature. Atlas Roofing Co. v. OSHRC, 430 U.S. 442 (1977); Frank Irey, Jr., Inc. v. OSHRC, 519 F.2d 1200 (3d Cir. 1974), aff'd on rehearing en banc, 519 F.2d 1215 (3d Cir. 1975).[2/] The appropriate criteria to be applied in this civil administrative proceeding, Marshall v. Barlow's, Inc., supra; see U.S. v. Thriftimart, Inc., 429 F.2d 1006 (9th Cir.), cert. denied, 400 U.S. 926 (1970), are those set forth in Chevron Oil v. Huson, supra, and cited by the Court in United States v. Johnson:

> In the civil context, in contrast [to a criminal proceeding], the "clear break" principle has usually been stated as the threshold test for determining whether or not a decision should be applied nonretroactively. See, e.g., Chevron Oil Co. v. Huson, 404 U.S. 97, 106, 92 S.Ct. 349, 355, 30 L.Ed.2d 296 (1971). Once it has been determined that a decision has "establish[ed] a new principle of law, either by overruling clear past precedent on which litigants may have relied. . .or by deciding an issue of first impression whose resolution was not clearly foreshadowed," the Court has gone on to examine the history, purpose, and effect of the new rule, as well as the inequity that would be imposed by its retroactive application. Id., at 107, 92 S.Ct., at 355. See also Hanover Shoe, Inc. v. United Shoe Machinery Corp., 392 U.S. 481, 499, 88 S.Ct. 2224, 2234, 20 L.Ed.2d 1231 (1968).

102 S.Ct. at 2587 n.12; see also Northern Pipeline Constr. Co. v. Marathon Pipe Line Co., 102 S.Ct. 2858, 2880 (1982).

---

2/ My colleagues indicate that because this case concerns the retroactive application of a Fourth Amendment ruling, United States v. Johnson is the appropriate guide. However, the nature of the issue does not change the nature of the proceeding. In Zweibon v. Mitchell, 606 F.2d 1172 (D.C. Cir. 1979), the court of appeals applied the Chevron Oil Co. criteria to determine the retroactive application of the Fourth Amendment warrant requirement to national security surveillances in the context of a civil damage action. In addition, although the court reached the same result, it criticized the "District Court's overemphasis on criminal law concepts in rejecting retroactivity in this civil case." 606 F.2d at 1179 (emphasis in original).

The initial inquiry is whether the adjudicatory body established a new rule of law, either by overruling precedent or by announcing a rule that was "not clearly foreshadowed." Because Sarasota Concrete Co. did not overrule a prior ruling of the Commission, the inquiry is whether the ruling was "not clearly foreshadowed."

In Sarasota Concrete Co. the Commission applied established Fourth Amendment principles governing inspections under regulatory statutes previously set forth by the Court in Marshall v. Barlow's, Inc., supra, Camara v. Municipal Court, 387 U.S. 523 (1967), and See v. City of Seattle, supra, and concluded that the inspection initiated by an employee complaint was overbroad. Although the issue decided by the Commission was one of first impression in this forum, its resolution was based on Fourth Amendment principles of controlling significance.[3/] Accordingly, it cannot be said that Sarasota Concrete Co. established a new principle of law that was "not clearly foreshadowed," so as to justify prospective effect only. See Zweibon v. Mitchell, 606 F.2d 1172, 1177-79 (D.C. Cir. 1979).[4/] Accordingly, I concur in the disposition of this case.

---

3/ As the administrative agency charged with the responsibility of formulating a uniform national body of occupational safety and health law, the Commission need not acquiesce in views of the federal lower courts that conflict with those of the agency. However, the Commission is bound to follow and apply decisions of the United States Supreme Court. See Raybestos Friction Materials Co., 80 OSAHRC 111/E14, 9 BNA OSHC 1141, 1143, 1980 CCH OSHD ¶24,910 at p. 30,719 (No. 80-2793, 1980); Farmer's Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1656 n.4, 1980 CCH OSHD ¶24,569 at p. 30,080 n. 4 (No. 78-1708, 1980) and cases cited.

4/ The Secretary's reliance on its past inspection practice under its implementing regulations, 29 C.F.R. § 1903.11, to establish that Sarasota Concrete Co. represented a sharp break in the law does not compel a different result.

> Appellees' claimed reliance on prior Executive practice does not bear directly on our determination, since Executive actions cannot represent an authoritative source of constitutional standards. Zweibon I, supra note 6 [516 F.2d 594 (D.C.Cir. 1975) (en banc), cert. denied, 425 U.S. 944 (1976)], 170 U.S.App.D.C. at 25-26, 516 F.2d at 618-619.

Zweibon v. Mitchell, 606 F.2d at 1179 n. 36. But see Weinberg v. Mitchell, 588 F.2d 275 (9th Cir. 1978).

| CARL M. GEUPEL CONSTRUCTION COMPANY, INC., | : | |
| Respondent. | : | |

## DECISION AND ORDER UPON RECONSIDERATION

Taylor, Judge:

This case has been remanded to me to reconsider, in light of Sarasota Concrete Co., OSHRC Docket No. 78-5264 (April 27, 1981), my April 3, 1981, decision denying the respondent's motion for vacation of the citations and suppression of evidence. In Sarasota, the Commission held "that, when probable cause for an inspection is based solely on specific evidence of an existing violation, . . . the inspection should be limited to the alleged violative condition." My April 3, 1981, decision is contrary to the Sarasota decision insofar as it upholds the validity of the inspection warrant authorizing an inspection of the respondent's entire worksite on the basis of specific evidence of five violative conditions. Accordingly, that portion of my prior decison is vacated. However, I otherwise adhere to my decision of April 3, 1981, including the denial of the respondent's motion. In my opinion, the holding in Sarasota, which was rendered on April 27, 1981, should not be applied to suppress evidence obtained before April 27, 1981, as the result of a good faith inspection that exceeded the scope limitations announced in Sarasota.

The question of what constitutes adequate probable cause for the issuance of administrative inspection warrants is far from settled by the Federal courts. This is a developing area of the law. In particular, as indicated in my prior decision, the Federal courts are widely divided on the scope issue resolved by the Commission in Sarasota. The warrant application in this case was filed on October 7, 1980, the warrant was issued on October 14, 1980, and the inspection of the respondent's worksite on the West Virginia Turnpike began on October 15, 1980. Before any of these actions, a United States District Court located within the judicial circuit whose jurisdiction includes West Virginia upheld the validity of a full scope warrant issued on the basis of a limited scope employee complaint. In re Seaward International, Inc., No. 80-98 (W.D. Va., September 19, 1980),[1/] aff'd, No. 80-1708 (4th Cir., March 11, 1981). Considering this in conjunction with the unsettled state of the law on probable cause for the issuance of administrative inspection warrants, I conclude that the complainant acted in good faith in applying for a warrant to inspect the respondent's entire worksite and in conducting such a broad inspection.

As the Commission so correctly recognized in Sarasota, the primary purpose of the exclusionary rule is to deter future illegal conduct of law enforcement personnel. The Sarasota decision will achieve this purpose in the future, but retroactive application of that decision will not enchance Sarasota's salutary effect, particularly in situations where governmental officials have acted in good faith.[2/]

---

1/ Unofficially reported at 1980 CCH OSHD ¶ 24,794.

2/ It is well-settled that the exclusionary rule should not be applied in those instances where governmental officials acted in a good faith, although mistaken, believe that their conduct was lawful. See, e. g., United States v. Peltier, 422 U.S. 531 (1975); Michigan v. Tucker, 417 U.S. 433 (1974); United States v. Williams, 622 F.2d 830 (5th Cir. 1980).

The respondent's contention that "[t]he non-retroactivity issue is concerned with only those cases where there were convictions already obtained" is incorrect. See, e. g., Michigan v. Tucker, supra; Desist v. United States, 394 U.S. 244, 254 (1969).

I addressed the respondent's argument that 29 U.S.C. § 657(f)(1) limits the complainant's inspection authority in my prior decision in which I held that "section 657(f)(1) merely states the minimum action that must be taken by the complainant when there has been an employee complaint." This conclusion is supported by a portion of the lead opinion in Burkhart Randall Division of Textron, Inc. v. Marshall 625 F.2d 1313, 1326 (7th Cir. 1980), to which neither of the two separate opinions takes exception.

Accordingly, after reconsideration of my prior decison, the respondent's motions for vacation of the citations and suppression of evidence is again denied.

OF Ruling on respondent's request for certification of interlocutory appeal.

TO WIT: Denied. In my opinion, the portion of my April 3, 1981, decision pertaining to the validity of the ex parte inspection warrant does not present an issue about which there is a substantial ground for difference of opinions. Moreover, I conclude that the proceedings will not be expedited by an immediate appeal of any of my rulings in that decision. Even if I were reversed as to the portion of my opinion regarding the scope of the warrant, there should be no dismissal of any of the charges without an evidentiary hearing. Such a hearing is necessary to determine the applicability of the plain view rule. The respondent's attempt to distinguish the noise citation in Docket No. 81-55 lacks merit. The citation indicates that the respondent's worksite was located on the West Virginia Turnpike, which apparently was public land. Therefore, dismissal of that citation would be inappropriate without an evidentiary hearing to ascertain whether there was an intrusion of sufficient magnitude to violate the Fourth Amendment. I also note the material quoted by the respondent from Marshall v. Central Mine Equipment Co., 608 F.2d 719, 721 (8th Cir. 1979), is dictum.

## DECISION AND ORDER ON RESPONDENT'S MOTIONS TO SUPPRESS EVIDENCE AND VACATE CITATIONS

Taylor, Judge:

In motions to suppress evidence and vacate the citations in these cases, the respondent contends that the inspection warrant obtained by the complainant was "improper and illegal" for several reasons. For reasons that follow, the respondent's motions are denied.

The complainant's inspection was conducted pursuant to an inspection warrant issued by a Federal magistrate of the United States District Court for the Southern District of West Virginia. The warrant application asserts that the complainant received an employee complaint that alleged that the following unsafe conditions existed at the respondent's worksite:

> no back-up alarms on Mack dump trucks, excessive dust and insufficient use of water trucks, operation of trucks within three feet of loaded and primed holes, operation of two-way radios in proximity to loaded holes, and improper transportation of explosives.

A copy of the employee complaint, which indicates the complaint was filed by an employee representative, was attached to the warrant application.

The respondent does not contend that there was inadequate probable cause to support the issuance of an inspection warrant authorizing an inspection of the conditions referred to in the complaint. Instead, the respondent contends that the inspection warrant was defective in that it authorized inspection of the entire worksite,[1/] rather than limiting it to the hazards alleged in the complaint.

The complainant contends that he may be permitted to make an inspection of all activities at a worksite after demonstrating probable cause to believe that violations of the Act are occurring in connection with only some of the operations being conducted at an employer's worksite. I agree with the complainant's contention where, as here, the warrant limits the inspection to safety and health matters that fall within the purview of the Act[2/] and conforms to the reasonableness requirements prescribed in the Act. See In re Blocksom and Co., No. S 76-170 (N. D. Ind., November 1, 1977).[3/]

---

1/ The warrant authorized the complainant to:

> inspect and investigate in a reasonable manner and to a reasonable extent . . . the workplace or environment where work is performed by employees of the employer and all pertinent conditions, structures, machines, apparatus, devices, equipment, materials, and all other things therein (including records, files, papers, processes, controls, and facilities) bearing on whether this employer is furnishing to its employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical injuries to its employees, and whether this employer is complying with the Occupational Safety and Health Standards promulgated under the Act and the rules, regulations, and orders issued pursuant to the Act. (Emphasis added.)

2/ See footnote 1, supra.

3/ Unofficially reported at 6 BNA OSHC 1001. See especially 6 BNA OSHC 1012-1013.

My conclusion that the inspection warrant is not overly broad is consistent with the Supreme Court's recognition that probable cause for an area inspection of private property may be established by an agency's "appraisal of conditions in the area as a whole," rather than on the agency's "knowledge of conditions in each particular building" to be inspected.[4/] Camara v. Municipal Court, 387 U. S. 523, 536 (1967). Of course, the probable cause requirements for inspecting business premises are even less strict than those for inspecting private homes. See v. City of Seattle, 378 U. S. 541, 545–546 (1967).

In the See case, the Supreme Court indicated that probable cause for issuing an inspection warrant is to be measured "against a flexible standard of reasonableness that takes into account the public need for effective enforcement of the particular regulation involved." 387 U. S. at 545. In Camara, the Court recognized that "the public interest demands that all dangerous conditions be prevented or abated." 387 U. S. at 537. I have considered these principles in concluding that a general inspection of a worksite is permissible when a warrant application establishes a reasonable belief that hazardous conditions may exist as to specific operations conducted at a worksite. See Dravo Corp. v. Marshall, Civil Action No. 77–284 (W. D. Pa., April 5, 1977),[5/] aff'd, 578 F.2d 1373 (3d Cir. 1978). A contrary conclusion would frustrate the Act's purpose of assuring "so far as possible every working man and woman in the Nation safe and healthful working conditions and to preserve our business resources"[6/] and, therefore, be adverse to the public interest in preventing and abating hazardous conditions. See In re Gilbert & Bennett Manufacturing Co., 589 F.2d 1335, 1343 (7th Cir. 1979); In re

---

4/ As a corollary to this, it follows that, when the probable cause requirement is satisfied as to particular activities at a worksite, a reasonable basis is provided for a belief that the same or other hazardous conditions may exist as to other activities at the worksite.

5/ Unofficially reported at 5 BNA OSHC 2057.

6/ 29 U.S.C. § 651(b).

Chicago Magnet Wire Corp. No. 77 C 3025 (N. D. Ill., October 27, 1977).[7/] As the Supreme Court acknowledged in Camara, "reasonableness is . . . the ultimate standard." 387 U. S. at 539. A general inspection was reasonable in the instant case. Just as hazardous conditions in a dwelling "may not be apparent to the inexpert occupant himself,"[8/] safety and health hazards at a place of employment may not be apparent to employees who normally do not possess any expertise in safety and health matters. Therefore, employees cannot be expected to complain about many hazardous conditions that exist in their work environment.

A number of Federal court decisions, some of which are cited by the repondent, support the respondent's position. However, I believe those decisions do not adequately recognize that administrative inspection warrants, rather than search warrants, were in issue in those cases and that the establishment of "[p]robable cause in the criminal law sense" is not required for issuance of an administrative inspection warrant. Marshall v. Barlow's, Inc., 436 U. S. 307, 320 (1978). In my view, a better approach on the scope of administrative inspection warrants has been taken in decisions such as Burkart Randall Division of Textron, Inc. v. Marshall, 625 F.2d 1313, 1322-1326 (7th Cir. 1980); In re Seaward International, Inc., No. 80-98 (W. D. Va., September 19, 1980),[9/] aff'd, No. 80-1708 (4th Cir., March 11, 1981); In re Marsan Co., No. S 79-90 (N. D. Ind., June 21, 1979);[10/] and In re Chicago Magnet Wire Corp., supra.

The respondent also contends that 29 U.S.C. § 657(f)(1) precludes a general inspection in this case. Section 657(f)(1) requires the complainant to make a "special inspection" upon receipt of an employee complaint if he determines there are reasonable grounds to believe that a violation or an imminent danger exists at a

7/ In re Chicago Magnet Wire Corp. is unofficially reported at 5 BNA OSHC 2024.

8/ Camara v. Municipal Court, supra, 387 U.S. at 537.

9/ Unoffically reported at 1980 CCH OSHD ¶ 24,794.

worksite. As the Seventh Circuit indicates in Burkart Randall Division of Textron, Inc. v. Marshall, supra, 625 F.2d at 1326, section 657(f)(1) merely states the minimum action that must be taken by the complainant when there has been an employee complaint. I do not view the provision as a limitation on the authority of the complainant to make general inspections. I find nothing in the legislative history of the statute that supports the respondent's position.

Relying principally on Cerro Metal Products v. Marshall, 620 F.2d 964 (3rd Cir. 1980), and that decision's interpretation of Marshall v. Barlow's, Inc., supra, the respondent contends that the issuance of the warrant was invalid because it was issued ex parte without affording the respondent notice of the warrant application and an opportunity to oppose it. The district court initially held in Cerro[11/] that the complainant was not authorized to apply for an ex parte inspection warrant under an unamended version of 29 C.F.R. § 1903.4. After amendment of that regulation, the district court held[12/] that the complainant was still not authorized to seek an ex parte warrant because the amendment of 29 C.F.R. § 1903.4[13/] to define "compulsory process" as including ex parte warrants was invalid in that the amendment was promulgated without first affording the public with notice of the

11/ 467 F. Supp. 869 (M. D. Pa. 1979).

12/ Id.

13/ The regulation was amended on December 22, 1978. 43 Fed. Reg. 59838 (1978). Under paragraph (a) of 29 C.F.R. § 1903.4, as amended, when an inspector is refused entry into a worksite selected for inspection, he is required to render a report to the area director who, after certain consultations, "shall take appropriate action, including compulsory process, if necessary." Except for minor deletions, this paragraph made no changes in the prior version of § 1903.4. Paragraphs (b), (c), and (d) were added to § 1903.4 by the amendment. The Cerro decisions focus on paragraph (d) which provides the following:

> For purposes of this section, the term compulsory process shall mean the institution of any appropriate action, including ex parte application for an inspection warrant or its equivalent.

After purportedly following the rulemaking procedures provided in 5 U.S.C. § 553, the complainant again amended 29 C.F.R. § 1903.4. 45 Fed. Reg. 65916 (October 3, 1980). This version also indicates that compulsory process includes ex parte applications for inspection warrants. The latest amendment is not relevant to the instant cases as the inspection warrant was issued before November 3, 1980, the effective date of the amendment.

contemplated amendment and an opportunity to comment upon it as required by 5 U.S.C. § 553. The Third Circuit affirmed the district court. 620 F.2d at 983.

In my opinion, the amendment of 29 C.F.R. § 1903.4 is exempt from the rulemaking requirements of the Administrative Procedure Act by the interpretive rule exception contained in 5 U.S.C. § 553(b)(A). Marshall v. W. and W. Steel Co., 604 F.2d 1322 (10th Cir. 1979); In re Seaward International, Inc., supra; Amoco Oil Co. v. Marshall, Civil Action No. G-80-45 (S. D. Tex., September 9, 1980);[14/] In re S. D. Warren, Division of Scott Paper, No. Misc. 79-69 P (D. Me., December 14, 1979).[15/] Moreover, since the term "compulsory process" is broad enough to include ex parte warrants, an application for an ex parte warrant would be lawful even if 29 C.F.R. § 1903.4 had not been amended. Stoddard Lumber Co. v. Marshall, 627 F.2d 984, 989-990 (9th Cir. 1980).

"Compulsory" means "involuntarily, . . . coerced by legal process." Black's Law Dictionary 359 (Rev. 4th ed. 1968). An inspection warrant meets this criteria. As the district court recognized in footnote 9 of its Cerro decision, " 'compulsory process' does not have to connote adversary process." Traditionally, search warrant proceedings have been ex parte.[16/] See In re Sauget Industrial Research and Waste Treatment Association, Civil No. 79-4105 (S. D. Ill., September 12, 1979);[17/] McCormick on Evidence 383 (2d ed. 1972).

To support their conclusions in Cerro that "compulsory process" as used in the unamended version of 29 C.F.R. § 1903.4 did not include ex parte warrants, both the district court and the Third Circuit refer to footnote 15 in the Barlow's decision, which provides the following at 436 U. S. 320:

14/ Unofficially reported at 8 BNA OSHC 2030.

15/ Unofficially reported at 7 BNA OSHC 2010.

16/ It has been said that "[t]he issuance of an inspection warrant is, of necessity, an ex parte proceeding." Marshall v. Horn Seed Co., No. CIV-78-1308-T (W. D. Okla., March 16, 1979), unofficially reported at 7 BNA OSHC 1182. This is consistent with the Supreme Court's observation in Barlow's that "the Act . . . regulates a myriad of safety details that may be amenable to speedy alteration or disguise." 436 U. S. at 316.

17/ Unofficially reported at 7 BNA OSHC 1773.

> Insofar as the Secretary's statutory authority is concerned, a regulation expressly providing that the Secretary could proceed ex parte to seek a warrant or its equivalent would appear to be as much within the Secretary's power as the regulation currently in force and calling for "compulsory process."

Both Cerro decisions also rely on the Solicitor General's arguments before the Supreme Court in concluding that "compulsory process" as used in the unamended version of 29 C.F.R. § 1903.4 did not include ex parte warrants. As acknowledged in the Cerro decisions, however, the Court's interpretation of § 1903.4 was "dictum." Equally significant at least, is the Court's pronouncement in Barlow's that:

> The District Court did not address the issue whether the order for inspection that was issued in the case was the functional equivalent of a warrant, and the Secretary has limited his submission in this case to the constitutionality of a warrantless search of the Barlow establishment authorized by [29 U.S.C. § 657(a)]. He has expressly declined to rely on 29 C.F.R. § 1903.4 and upon the order obtained in this case.

436 U.S. at 325 n. 23. Thus, it is clear that the meaning of the unamended version of § 1903.4 was not fully litigated before the Court and that the Court's dictum relates to a matter that only peripherally touched the ultimate issue of the validity of warrantless searches.[18/] In re S. D. Warren, Division of Scott Paper, supra.

---

18/ The Barlow's decision notes that provisions in the 1972 Compliance Operations Manual for OSHA inspectors pertaining to ex parte warrants and to the obtaining warrants upon anticipating an entry refusal were deleted from that manual's successor, OSHA Field Operations Manual, Vol. V, at V-4-V-5, "leaving only the details for obtaining 'compulsory process' after an employer has refused entry." 436 U. S. at 318 n. 13. However, since change 2 of the Field Operations Manual was published in January 1976, paragraph D1c(8), in Chapter V of the manual, has indicated that "[e]xcept in unusual circumstances, . . . there shall be no advance notice to the employer concerning compulsory process." This tends to negate the Court's equivocal conclusions that "the kind of process . . . apparently anticipated by the regulation provides notice to the business operator." 436 U.S. at 318 (emphasis added). Moreover, the complainant has demonstrated that he construed § 1903.4 as encompassing ex parte warrants by submitting, before issuance of the Barlow's decision, numerous applications for such warrants. See, e. g., Pelton Casteel, Inc. v. Marshall, 588 F.2d 1182 (7th Cir. 1978); Weyerhaeuser Co. v. Marshall, 452 F. Supp. 1375 (E. D. Wis. 1978), aff'd 592

(Footnote Continued)

In addition to the cases cited above, several other decisions rendered after the Barlow's decision have approved what appear to be ex parte warrant applications. See, e. g., In re Gilbert & Bennett Manufacturing Co., 589 F.2d 1335 (7th Cir. 1979); Pelton Casteel, Inc. v. Marshall, 588 F.2d 1182 (7th Cir. 1978); Marshall v. Miller Tube Corp. of America, No. 78-C-1591 (E. D. N.Y., October 12, 1978).[19] Pelton Casteel and Miller Tube were decided before the amendment to 29 C.F.R. § 1903.4 was published. Gilbert & Bennett was decided 11 days after the amendment was published, making it doubtful that the court was aware of the amendment when the decision was rendered. No concern was expressed in any of the three decisions as to the necessity for clarifying the term "compulsory process" as used in § 1903.4.

Sound logic dictates the conclusion that a prior amendment to § 1903.4 was not necessary to validate applications by the complainant for ex parte warrants. Such a requirement would unduly elevate form over substance and conflict with the Act's purpose of achieving safe and healthful working conditions for employees.[20] Simply put, the Supreme court has indicated in Barlow's that ex parte inspection warrants are permissible,[21] the issuance of ex parte warrants is consistent with

18/ (Footnote Continued)

F.2d 373 (7th Cir. 1979); In re Quality Products, Inc., No. 77-0075 M-00 (D. R. I., May 30, 1978), unofficially reported at 6 BNA OSHC 1663, rev'd, 592 F.2d 611 (1st Cir. 1979); Marshall v. Multi-Cast Corp., No. C77-414 (N. D. Ohio, January 10, 1978), unofficially reported at 6 BNA OSHC 1486; Marshall v. Silberline Manufacturing Co., Civil Action No. Misc. 77-24 (M. D. Pa., October 20, 1977); Marshall v. Chromalloy American Corp., 433 F. Supp. 330 (E. D. Wis. 1977), aff'd, 589 F.2d 1335 (7th Cir. 1979); In re Gilbert & Bennett Manufacturing Co., Civ. No. 77 C 856 (N. D. Ill., April 12, 1977), unofficially reported at 5 BNA OSHC 1375, aff'd, 589 F.2d 1335 (7th Cir. 1979).

19/ Unofficially reported at 6 BNA OSHC 2042.

20/ In those situations where entry was denied, a contrary conclusion would leave employees unprotected from worksite hazards while the complainant went through the formality of amending the regulation. Of course, requiring the complainant to resort to the time-consuming rulemaking procedures required by 5 U.S.C. § 553 would extend even further the time that these employees were not protected.

21/ 436 U. S. at 320.

congressional intent to achieve surprise and to avoid delay,[22/] and the term "compulsory process" is sufficiently broad to include ex parte warrants. Accordingly, I find no merit in the respondent's argument that the Commission should adopt the Cerro holdings.

The respondent contends that the inspection warrant was improperly issued because the warrant application did not comply with 28 U.S.C. § 1746. The respondent also points out that the employee complaint attached to the application did not reveal the name of the complaining employee. There is not a scintilla of merit in the respondent's contention.

The warrant application is signed by one of the complainant's area directors. The application also indicates that it was sworn to before the United States Magistrate and subscribed in his presence. This constitutes proper execution of the warrant application. When so executed, there is no necessity to support the application with an employee complaint, much less reveal the name of the complaining employee. See Marshall v. Milwaukee Boiler Manufacturing Co., 626 F.2d 1339, 1345 (7th Cir. 1980); In re Gilbert & Bennett Manufacturing Co., supra, 589 F.2d at 1339.

The respondent alleges that the warrant application is defective because neither it nor the employee complaint contains the following statement specified in 28 U.S.C. § 1746(2):

---

22/ In this connection, the United States Court of Appeals for the Fifth Circuit has stated:

> [I]t seems likely that Congress, desiring an enforcement scheme based on surprise and undelayed searches, would very much prefer immediate execution of duly-issued ex parte warrants to the litigation-ladened delays urged on us by the search-shy Secretary in this case. By denying jurisdiction for injunctive suits initiated by the Secretary, Congress postpones and reduces the adversary litigation that otherwise might undermine the efficient and speedy implementation of the Act. In addition, Congress puts pressure on the Secretary to implement the Act unburdened by the excessive bureaucratic caution and paperwork which plague so much of our govenement.

Marshall v. Shellcast Corp., 592 F.2d 1369, 1372 (5th Cir. 1979).

"I declare (or certify, verify, or state) under penalty of perjury under the laws of the United States of America that the foregoing is true and correct."

However, 28 U.S.C. § 1746, merely provides that this language may be used in the United States instead of other declarations required by law, including sworn declarations. This case is distinguishable from Tran-Tec Corp., OSHRC Docket No. 80-1308 (November 26, 1980),[23/] cited by the respondent. In Tran-Tec, neither the employee complaint nor the warrant application was executed under oath. Here, the warrant application was executed under oath.

Accordingly, the respondent's motions for vacation of the citations and suppression of evidence are denied.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>J.L. MANTA PLANT SERVICES COMPANY,<br>Respondent. | OSHRC Docket No. 78-4923 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor ("the Secretary") issued to J.L. Manta Plant Services Company ("Manta") two citations alleging that Manta had violated several parts of the coke oven emissions standard at 29 C.F.R. § 1910.1029 including section 1910.1029(c), which regulates employee exposure to coke oven emissions, and section 1910.1029(g)(3), which requires a respiratory protection program. 1/

Before the hearing, Manta moved to vacate both citations on the ground that section 1910.1029 could not be validly applied to non-coke oven employees. Judge Louis J. Rubin granted Manta's motion and vacated the citations. 2/ In his petition for review, the Secretary sought review of the judge's decision.

---

1/ This case was consolidated before the judge with four other cases: Nos. 78-4731, 78-5043, 78-5051 and 78-5060. The Secretary petitioned for review of the Manta case and Furnco Construction Co., No. 78-4731. Commission review was granted. Later, the Commission approved a settlement agreement in Furnco and granted the parties' joint motion to sever Furnco from this case.

2/ The judge relied on American Iron & Steel Institute v. OSHA, 577 F.2d 825 (3d Cir. 1978). In that case, the court remanded section 1910.1029 to the Secretary for further proceedings as to whether the standard applied to non-coke oven employees. We have been unable to find any subsequent rulemaking actions by the Secretary that would have cured the problem that has made the standard unenforceable as to non-coke oven employees such as Manta's.

In the last paragraph in his petition, the Secretary also moved to amend in the alternative to allege violations of the general industry standards at sections 1910.1000(a)(2) and (e), which regulate employee exposure to coal tar pitch volatiles ("CTPV"). The motion was evidently made under Federal Rule of Civil Procedure 15(a). 3/ Commissioner Cleary directed the case for review on the following issues:

> [1] In light of American Iron and Steel Institute, 577 F.2d 825 (3d Cir. 1978), did the administrative law judge properly vacate the citation alleging a violation of the coke oven emissions standard, 29 C.F.R. §1910.1029?
>
> [2] Whether §9(c) of the Act precludes amendment of the citation to 29 C.F.R. §§1910.1000(a)(2) and (e)?

The first of these issues is no longer before us. In the Secretary's brief before the Commission, the Secretary abandoned his argument that the judge erred in holding that section 1910.1029 could not be validly applied to Manta. He also changed his position on the amendment issue. Although stating that he was withdrawing one of the two citations, the Secretary asked to amend the other citation. However, he did not ask to amend to the general industry standards mentioned in his petition for review. Instead, he asked that the citation be amended under Federal Rule 15(a) to allege violations of the construction industry standards at sections 1926.55(a)(CTPV standard), 1926.103(c)(1)(instruction on the use and care of respirators) and 1926.21(b)(2)(instruction on avoidance of unsafe conditions and applicable regulations), and the general industry standards at 1910.134(b)(1)(written standard operating procedures for selection and use of respirators) and 1910.134 (b)(6)(storage of respirators in a convenient, clean, and sanitary location). The Secretary explained in a footnote

---

3/ Rule 15. Amended and Supplemental Pleadings.

(a) Amendments.

* * *

[A] party may amend his pleadings only by leave of court or by written consent of the adverse party; and leave shall be freely given when justice so requires.

* * *

in his brief that "[a]fter further evaluation the Secretary has determined that Part 1926 (construction) standards are more properly cited in [this case] because [Manta] was engaged in construction, repair and maintenance work . . . ."

We deny the motion to amend. The Secretary did not request amendment under Federal Rule 15(a) before the judge. Indeed, the motion to amend now before us was not made until the Secretary filed his brief on review; as we have noted, the Secretary's petition first sought amendment to different standards. Under Commission Rule of Procedure 92(d), 29 C.F.R. § 2200.92(d), 4/ the Commission ordinarily reviews only those issues that have been raised before the administrative law judge. See Willamette Iron & Steel Co., 81 OSAHRC 59/A2, 9 BNA OSHC 1900, 1904, 1981 CCH OSHD ¶ 25,427, p. 31,699 (No. 76-1201, 1981). This common rule of orderly procedure embodies the view that it is sounder practice to not pass on issues that the hearing judge has not had an opportunity to consider unless there are extraordinary circumstances. Similarly, courts have held that where a party had an opportunity to move to amend under Federal Rule 15(a) before an appeal and did not, the motion comes too late. See Swan v. Board of Education, 319 F.2d 56, 61 (2d Cir. 1963).

There are no circumstances here excusing the Secretary's failure to move to amend before the judge. Employers have often filed pre-hearing motions to vacate citations because the cited standard is invalid or inapplicable. The ordinary course is for the Secretary to then move to amend his citation to alternatively allege violations of other arguably applicable standards. The Secretary not only had the opportunity to so amend, he did not do so even though the construction standard at section 1926.55 would have been at least arguably applicable to construction contractors if the judge were to find that section

---

4/ Rule 92 Review by the Commission.

* * *

(d) . . . Except in extraordinary circumstances, the Commission's power to review is limited to issues of law or fact raised by the parties in the proceedings below.

1910.1029 could not be validly applied. The record supplies no reason why counsel for the Secretary could not have foreseen that the judge might have disagreed with his validity argument, and taken the elementary step of moving before Judge Rubin to alternatively amend to the construction standard. 5/

In short, the Secretary had an opportunity to raise the amendment issue before the judge and did not do so. Inasmuch as he has not shown any circumstances excusing this failure, we deny the motion to amend. 6/ The judge's decision is affirmed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: NOV 3 1982

---

5/ This lack of foresight was particularly inexplicable here because the possible application of section 1926.55 has figured prominently in coke oven litigation involving construction contractors. The United States Court of Appeals for the Third Circuit had remanded section 1910.1029 as to construction contractors because the court had "serious reservations concerning the broad construction of the standard's applicability to independent contractors contained in" a March 3, 1977, letter by Bert Concklin, then Acting Assistant Secretary of Labor for Occupational Safety and Health. American Iron & Steel Institute v. OSHA, 577 F.2d 825, 840 (3d Cir. 1978). In that letter, a request by the National Erectors Association for a stay of section 1910.1029 as to construction contractors and interim enforcement of the construction standard at section 1926.55 was rejected by Mr. Concklin on the sole ground that there was no applicable construction standard.

This point also appeared in the background of this case. The Secretary had appended the Concklin letter to his brief before Judge Rubin. In addition, both parties to this litigation had included in their stipulation of facts an unpublished supplemental statement by the Labor Department of reasons for the applicability of section 1910.1029. Like the Concklin letter, this supplemental statement declared that "the construction standards do not deal with the health hazard of carcinogenic coke oven emissions . . . ." Yet, now the Secretary evidently thinks otherwise. The Labor Department's failure to follow a consistent course on this question unnecessarily delayed the final disposition of this case and prevented an orderly resolution of the merits.

6/ Because we deny the motion on this ground, we need not consider whether the Secretary's motion should be denied because it raises issues different from those in the petition. See Commission Rule 92(c), 29 C.F.R. § 2200.92(c).

COTTINE, Commissioner, dissenting:

The majority narrowly construes Commission Rule of Procedure 92(d) which was meant to encourage orderly procedure and yet not unnecessarily foreclose a decision on the merits. Rather than precipitously dismissing this case, I would remand to the judge to consider whether the second motion to amend should be granted. 7/

Under Commission Rule of Procedure 92(d), review is ordinarily limited to issues raised before the administrative law judge. However, this case has only progressed to pre-hearing motions before the judge. In fact, this case was in the early stages of preparation for the hearing when the citations were vacated on a pre-hearing motion. Although the Secretary had an opportunity to alternatively amend to section 1926.55 at that early stage, the parties' attention was then focussed on the larger issue of whether the new coke oven standard applied to non-coke oven employees. Under these circumstances, the Secretary's failure to move to amend was not so egregious as to warrant dismissal. 8/

---

7/ I do not agree with the intimation in the majority opinion that the amendment issue might not properly be on review under Commission Rule 92(c). The rule states in part that "review shall be limited to the issues specified in the petition . . . ." Although the majority does not mention it, §§ 1926.55 and 1910.1000 have precisely the same threshold limit values for CTPV and require the same abatement methods. The Secretary's motions to amend to the general industry standard and to the precisely equivalent construction industry standard do not present different issues that would frustrate Commissioner Cleary's exercise of discretion in directing review on whether section 9(c) of the Act precludes amendment to the general industry standard and implicitly whether amendment is proper under Fed. R. Civ. P. 15(a).

8/ In note 5 of the lead opinion, the majority maintains that the Secretary's failure to move to amend was "inexplicable" because the applicability of § 1926.55 had "figured prominently in coke oven litigation" and had "appeared in the background of this case." The Secretary's actions are inexplicable to my colleagues because they mischaracterize the role that § 1926.55 has played here. The applicability of § 1926.55 did not occur to either party when this case was before the judge. The papers relied on by the majority were introduced as mere background to another issue. To magnify their significance now is inappropriate.

The majority's conclusion that the Secretary's positions have been inconsistent is also incorrect. The Secretary's statements that § 1926.55 was

(cont'd)

The majority's mechanical invocation of Commission Rule 92(d) is particularly unfortunate here. Federal Rule of Civil Procedure 15(a) states, among other things, that "leave [to amend] shall be freely given when justice so requires." The Supreme Court has construed this clear language as allowing liberal amendments, even after a complaint has been dismissed, so that the parties are given an opportunity to have their claims decided on the merits. See Foman v. Davis, 371 U.S. 178, 182 (1962). It is in this light that Commission Rule 92(d) should be applied here.

Accordingly, I would remand this case for consideration of whether the second motion to amend should be granted. Manta claims that its new officers and directors did not have knowledge of the corporation's activities at the time of the alleged violations and would have to rely on records which do not contain information on the amended citation. The judge is in a better position to resolve these factual matters and determine whether amendment would be proper.

---

(Footnote 8 cont'd)

inapplicable reflected nothing more than his completely plausible view that because the new coke standard comprehensively addressed the matter of coke ovens, the old construction standard had been pre-empted to that extent. This reasoning should be familiar to the majority. See, e.g., John T. Brady & Co., 82 OSAHRC 9/D10, 10 BNA OSHC 1385, 1982 CCH OSHD ¶ 25,941 (No. 76-2894, 1982), rev'd, No. 82-4082 (2d Cir. October 14, 1982). It was only when Judge Rubin held that the new standard could not be validly applied that the Secretary sought to apply the old standard. There is no inconsistency in that.

ORDER ON MOTION TO DISMISS

Respondent's Motion to Dismiss citations issued under the coke oven emissions standards (29 CFR 1910.1029) is granted.

The chronology and factual background is briefly summarized, setting forth facts not in dispute and stipulated by the parties:

1. On October 19, 1976, the Secretary of Labor promulgated a new health standard governing employee exposure to coke oven emissions (29 CFR 1910.1029).

2. Petitions for review were filed by several coke producers and their trade associations with the United States Court of Appeals for the Third Circuit. The Court issued its opinion and order

on March 28, 1978, American Iron and Steel Institute, et al. v Occupational Safety and Health Administration, 577 F.2d 825 (3rd Cir. 1978) which held in pertinent part, "the Secretary's coke oven emissions standard (is) affirmed except: . . . . . (3), application of the standard to non-coke oven employers." The court remanded the case for further proceedings consistent with its opinion as to the application of the standard to non-coke oven employers.

3. Respondents are non-coke oven employers who were engaged in construction and maintenance services, as independent contractors, at the Inland Steel plant, East Chicago, Indiana, in August 1978.

4. They were cited in September and October 1978, for violation of the standard.

5. In December 1978, OSHA issued a "Supplemental Statement of Reasons" which states, "This notice delineating the precise application of the standard to non-coke producing employers is in response to the remand ordered by the Court."

6. On January 12, 1979, OSHA published a notice in the Federal Register at page 2725 stating that the Advisory Committee on Construction Safety and Health, (Advisory Committee) would meet on January 31 and February 1, 1979 to consider the application of the

coke oven standard to non-coke oven employers. The Supplemental Statement was then presented to the Advisory Committee.

7. The Advisory Committee met on May 17, 1979, pursuant to a notice in the Federal Register on April 27, 1979, and formulated its recommendations. The Advisory Committee accepted OSHA's determination that the scope and application of the standard, (29 CFR 1910.1029) (a)) applied to all employers. Some disagreement was expressed with parts of the Supplemental Statement. The areas of disagreement have no direct bearing on the issue raised here.

Complainant's position is that the order of remand did not stay enforcement proceedings against non-coke oven employers. Consistent with its position, the Secretary did not institute any rule making proceeding. Instead, a "Supplemental Statement of Reasons" was drafted for public consideration for the purpose of informing the Court of the precise application of the standard to independent contractors.

Respondents maintain that the citations were issued in violation of the Court order and are invalid. Respondents argue that the Court was concerned with due process rights to notice and they were not afforded such notice. Respondents were cited in the interim period between the Court order and publication in the Federal Register of the "Supplemental Statement of Reasons."

The Court's opinion, section VI, deals with the application of the standard to non-coke oven employers. The Court recites the arguments favoring the Secretary's position; announces its conslusion that, despite these arguments, notice was inadequate; and finally gives reasons for its conclusion (577 F.2d at 840). The case was remanded for further proceedings consistent with the opinion. A plain and logical reading would indicate that the Court was indeed concerned with due process rights to notice.

The case law submitted by the parties in support of their interpretations of the opinion and order is inconclusive. The decision cited do not involve notice of rule making, or the court specifically vacated or remanded with specific instructions for proceeding, or specifically ruled that the challenge should be pursued in an enforcement proceeding. However, I find respondent's argument and analogy to the Review Commission decision, in American Urethane Corp., 5 BNA OSHC 1543, 1977-78 CCH OSHD para. 21, 903 (1977) to be persuasive. In American Urethane Corp., the Review Commission interpreted the Third Circuit opinion in Synthetic Organic Chemical Mfrs. Ass'n (SOCMA II), 506 F.2d 385 (3rd Cir. 1974) cert. denied 423 U.S. 830 (1975). The Review Commission held that a Court order of remand does not stay enforcement proceedings where

the basis for the remand is the Court's desire to ascertain the reasons for the agency action. In contrast, when the basis for remand is failure to afford adequate notice, remand was predicated on the conclusion that the promulgation did not meet the requirements of section 6 of the Act and necessitates vacation of the relevant provisions. This conclusion is in accord with the view that an administrative rule not promulgated in accordance with the notice requirements of section 553 of the Administrative Procedure Act is not enforceable. N.L.R.B. v Wyman-Gordon Company, 394 U. S. 759 (1969); Wagner Electric Corp. v Volpe, 446 F.2d 1013 (3rd Cir. 1972); Texaco, Inc.v Federal Power Commission, 412 F.2d 740 (3rd Cir. 1969).

The Court has ruled that respondents did not receive adequate notice. Proceedings, in accordance with the Court order of remand, were not held prior to the issuance of the citations. The defect in promulgation precludes enforcement of the standard against respondents in this case. It is noted that the same issue was before Judge Sparks, Review Commission Judge, in C. H. Heist Corporation et al. (OSHRC Nos. 79-0749 et al., decided November 16, 1979). Judge Sparks held that lack of notice was a fundamental defect and that the standard should not be enforced until the defect has been remedied.

It is ORDERED:

1. The citations alleging violations of 29 CFR 1910.1029 are vacated.

2. General Drainage, Inc., No. 78-5043; M & O Insulation Company, No. 78-5051; and McAuliffe Mechanical Contractors, No. 78-5060 will be notified of the hearing date with respect to those items cited under standards other than 29 CFR 1910.1029.

3. This constitutes a final order with respect to Furnco Construction Co., No. 78-4731; and J. L. Manta, Inc., No. 78-4923.

Louis J. Rubin
Judge, OSHRC

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. Decora, Inc.
OSHRC Docket No. 81-2390

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 4, 1982, and will become the final order of the Commission on November 3, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 3, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

DAVID G. ORINGER
JUDGE, OSHRC

Att: James A. Magenheimer, Esq.

FOR THE RESPONDENT

J. Edward Goff, Vice-President
Legal Department
Decora, Inc.
P.O. Box 269
Millville, New Jersey 08332

DECISION AND ORDER

ORINGER, JUDGE: This is a proceeding under Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq., (hereinafter referred to as "the Act"), to review a citation issued by the Secretary of Labor (hereinafter sometimes referred to as "Complainant") pursuant to Section 9(a)

and a proposed assessment of penalties thereon issued, pursuant to Section 10(a), of the Act.

As a result of an inspection that took place between May 21 and June 2, 1981, the Secretary issued the Respondent a citation charging serious violations of sixteen standards in six items of the citation together with subparts thereof. The Secretary proposed penalties of $4,680 for the alleged violations.

After the case was reassigned from Judge Cerbone to the undersigned and after discovery had been requested, this tribunal scheduled a prehearing conference for April 8, 1982 and, on request of the parties, rescheduled it to April 12, 1982. Thereafter, on request of the parties, the case was again rescheduled to April 21, 1982, in New York, City, at which time the pretrial conference took place.

At the pretrial conference Counsel for Mr. Wheaton stated that he wished to put the Respondent's position on record and wanted a formal decision after considering the position of Mr. Wheaton, the owner.

During the pretrial conference, the Respondent's representative conceded that all of the allegations of violation were true. The Respondent's representative argued that no issue of fact remained for resolution. The tribunal advised that there was an issue of fact as to the penalty and that a penalty could not be assessed unless the facts concerning the violation were heard.

It is the opinion of the tribunal that the parties were looking for a ruling on the law and the tribunal requested the submission of briefs by the parties. No briefs were submitted by

the parties and, after the Commission had spoken on another similar case, the matter was set down for hearing for July 7, 1982 in New York City. Subsequent thereto, the Complainant moved for an adjournment on the grounds that the compliance officer would be testifying in another case on the same day. The motion also stated that the Respondent and his counsel had changed its position and were going to attempt to amicably resolve the case. The parties were ordered to draw up an Order and the tribunal adjourned the case sine die.

Subsequent thereto, on September 1, 1982, this tribunal received a settlement agreement worked out between the parties and, in consideration of the parties pleadings, pretrial conference, adjourned hearing, representations, de facto motions and all pertinent matters herein, the settlement agreement is disposed of as follows:

1. The Secretary's de facto motion to modify and amend the proposed penalty and the complaint so as to reflect a reduction of the original proposed penalty from $4,860 to an aggregate proposed penalty of $3,240 for all allegations of violation, is GRANTED.

2. The Respondent, having certified that all violations alleged in the complaint have been abated; that it will comply with the Act in futuro; that it has tendered the modified proposed penalty of $3,240 to the Secretary; that on August 31, 1982, the settlement agreement was posted where affected employees might see it and on August 27, 1982, a copy was served on the authorized employee representative; sufficient time having elapsed

and no objections having been filed thereto, the Respondent's de facto motion to withdraw its notice of contest to the allegations of violation as set forth in the citation and the modified proposed penalty of $3,240, is GRANTED.

3. Based on all of the above, the matter appears to be disposed of.

4. The allegations of serious violation by this Respondent of the standards set forth at 29 CFR 1910.1000(b)(1), 29 CFR 1910.1000(e), 29 CFR 1910.1025(c)(1), 29 CFR 1910.1025(f)(1), 29 CFR 1910.1025(d)(2), 29 CFR 1910.1025(e)(3)(ii(f), 29 CFR 1910.1025(g)(1), 29 CFR 1910.1025(h)(1), 29 CFR 1910.1025(i)(2)(i), 29 CFR 1910.1025(i)(2)(ii), 29 CFR 1910.1025(i)(3)(iii), 29 CFR 1910.1025(i)(4)(iii), 29 CFR 1910.1025(i)(4)(iv), 29 CFR 1910.1025(i)(1)(i), 29 CFR 1910.1025(i)(1)(ii), and 29 CFR 1910.1025(j)(1)(i), are all AFFIRMED and a total aggregate penalty of $3,240 is ASSESSED therefor.

SO ORDERED.

DAVID G. ORINGER, JUDGE, OSHRC

## NOTICE OF DECISION

Secretary of Labor v. Rodgers Construction, Inc.
OSHRC Docket NO. 82-0503 and 82-0504

1. Enclosed is a copy of my decision. It will be filed with the Commission on October 4, 1982, and will become the final order of the Commission on November 3, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is November 3, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>RODGERS CONSTRUCTION, INC.,<br><br>Respondent. | OSHRC DOCKET NO. 82-0503 and 82-0504 |

DECISION AND ORDER

Appearances: Robert A. Fitz, Esq., and Anne F. Watson, of Dallas, Texas, for the complainant.

David J. White, Esq., of Dallas, Texas, for the respondent.

BLYTHE, Judge:

PROCEDURAL HISTORY

This consolidated [1] proceeding resulted from two inspections conducted by compliance officers of the Occupational Safety and Health Administration ("OSHA") of a workplace at 2401 East Lamar Boulevard, Arlington, Texas, where the respondent, Rodgers Construction, Inc. [2] ("Rodgers"), as general contractor, was constructing a Hilton hotel.

---

[1] The cases were consolidated at the hearing on complainant's unopposed motion (Tr.3).

[2] In Docket No. 82-0503, respondent's name was incorrectly stated as Rodgers Construction Co. in the citations and complaint. This was corrected at the hearing (Tr.6).

The first inspection, conducted March 1-12, 1982, after a fatal accident, resulted in the issuance of a single citation to Rodgers by the Secretary of Labor ("the Secretary") on April 6, 1982, alleging two serious violations of §5(a)(2) of the Occupational Safety and Health Act of 1970, 29 USC §651, et seq. ("the Act"), and the standard at 29 CFR 1926.28(a) for failure to use safety belts.

The second inspection, conducted March 9-11, 1982, was a general schedule inspection which resulted in the issuance to Rodgers of two citations on April 13, 1982, alleging serious and nonserious violations of several safety standards.

Rodgers timely contested the citations in both cases April 30, 1982, initiating this proceeding before the Occupational Safety and Health Review Commission ("the Commission") under §10(c) of the Act. Thereafter a complaint and an answer were filed in each case.

The cases came on regularly for hearing July 15, 1982, at Dallas, Texas. No affected employee or authorized representative of affected employees participated in this proceeding.

Rodgers submitted a posthearing brief; the Secretary did not.

## THE ISSUES

The issues to be determined are:

1. Whether Rodgers is engaged in a business affecting commerce so that the Commission has jurisdiction of the proceeding.

2. Whether Rodgers was in serious violation of §1926.28(a) and/or §1926.105(a) (Docket No. 82-0503).

3. Whether Rodgers was in nonserious or serious violation of §1926.28(a) and/or §1926.105(a) (Docket No. 82-0504), including whether the Secretary should be allowed to amend the citation to allege a serious violation.

4. Whether Rodgers was in serious violation of §1926.451(m)(6).

5. Whether Rodgers was in serious violation of §1926.550(a)(4) and American National Standards Institute ("ANSI") Standard B30.2-1943(R.1952), ¶¶3021-3024.

6. Whether Rodgers was in nonserious violation of §1926.350(j) and ANSI Standard Z49.1-1967, §3.2.4.3.

7. Whether Rodgers was in nonserious violation of §1926.602(a)(9)(i).

8. Whether Rodgers has made out its affirmative defense of unpreventable employee misconduct to any of the citations.

9. The appropriate penalties for any violations found.

DISCUSSION AND OPINION

I. The jurisdictional issue.

Although Rodgers' brief does not discuss the jurisdictional issue, it was raised in its answer to the complaint and will therefore be discussed.

The answer denies that §10(c) of the Act confers jurisdiction on the Commission and that it engaged in a business affecting commerce within the meaning of §3(5) of the Act, which provides, in pertinent part:

> The term "employer" means a person engaged in a business affecting commerce who has employees..."

Rodgers' answer admits that it is engaged in construction as a general contractor. The uncontradicted evidence also establishes that it is a Tennessee corporation with headquarters in that state; that at the time of the inspection it was constructing a Hilton hotel in Arlington, Texas; and that

the job superintendent of the Arlington job makes frequent reports to Rodgers' headquarters in Tennessee (Tr.12).

The Secretary also requested that official notice be taken of the fact that Hilton hotels accommodate interstate travelers (Tr.197). Rodgers objected to this on the ground that it was a matter on which proof should be adduced. The matter was taken under advisement.

I find it unnecessary to decide the official notice issue. The facts that Rodgers is a Tennessee corporation doing business in Texas and that frequent reports are made on the Texas operation to Rodgers' headquarters in Tennessee are sufficient to put Rodgers directly into interstate commerce. Edward W. Vander Linden dba Shorecrest Concrete Contractors, 3 BNA OSHC 1739, 1975-76 CCH OSHD ¶20,166 (No. 3249, 1975). Therefore, its business automatically "affects" commerce, and the Commission has both personal and subject matter jurisdiction.

II. The alleged violations of §1926.28(a) and/or §1910.105(a).

Item 1 of citation 1, as amended, of Docket No. 82-0503 alleges two serious violations of §1926.28(a) [3] and/or §1926.105(a) [4], while item 1

---

[3] This standard provides:

§1926.28—PERSONAL PROTECTIVE EQUIPMENT

(a) The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

[4] This standard provides:

§1926.105—SAFETY NETS

(a) Safety nets shall be provided when workplaces are more than 25 feet above the ground or water surface, or other surfaces where the use of ladders, scaffolds, catch platforms, temporary floors, safety lines, or safety belts is impractical.

of citation 2, (Docket No. 82-0504) as amended at the opening of the hearing, alleges a nonserious violation of these standards. Therefore, they will be discussed together.

A.

Item 1 of citation 1 (Docket NO. 82-0503), as amended, alleges that §§1926.28(a) and/or 1926.105(a) were violated in that

> Safety belts with lanyards attached to adequately secured lifelines or other suitable supports are not worn by employees exposed to the hazard of falling from elevations:
>
> a. during the removal of guard rails from floor edges;
> b. from the upper part of building column forms located near the outer building sides and corners while pouring and vibrating concrete in the forms on the 9th and 10th floors of the building being constructed at 2401 E. Lamar Street, Arlington, Texas.

Subitem 1a. involves the fatality which precipitated the inspection. Carpenter Foreman Dennis E. Stephens fell nine floors to his death and Carpenter's Helper Bobby Wright [5] was injured in a one-story fall when the decking from which they were preparing to remove a guardrail collapsed due to removal of 4 x 4 supports beneath it. Stephens was wearing a safety belt and lanyard which was not tied off (Tr.25,26,37). Wright, who was subpoenaed as a witness by the Secretary but did not appear and testify, apparently was not wearing a safety belt (Tr.25,36). No safety net, ladder, scaffold, catch platform, temporary floor, or safety line was provided for fall protection, and Compliance Officer Henry R. Slagle testified without contradiction that such

---

David W. Swain, Rodgers' assistant superintendent with safety duties, described Wright as doing "nothing but safety" (Tr.180), but apparently this meant carpentry work on such things as guardrails.

devices would have been impractical. Thus the only full protection advocated by the Secretary is the safety belt.

Rodgers' position is that since the guardrail was still in place at the time of the accident safety belts were not required; Stephens and Wright were just preparing to remove the guardrail when they walked out on the unsupported decking.

The fallacy of this argument lies in the assumption that the citation is limited to the facts of this accident as they occurred. Such is not the case.

> Although evidence concerning the occurrence of and circumstances surrounding an accident is not necessary for the Secretary to establish a prima facie case, and certainly such evidence is not necessarily conclusive in finding a violation, the occurrence of and circumstances surrounding an accident may be probative evidence of a violation.

Ralston-Purina Co., 79 OSAHRC 22/C11, 7 BNA OSHC 1302, 1979 CCH OSHD ¶23,507 (No. 76-2551, 1979).

Guardrails on this job were constructed in 16-foot sections so that they could be detached and hoisted to the next floor. The standard operating procedure was for two or three carpenters to detach the guardrails—without safety belts or other fall protection—and for two others to lift them with ropes to their new position (Tr.26,29,31). Stephens and Wright were apparently preparing to follow this procedure when the decking collapsed.

It was possible for carpenters engaged in the detaching operation to tie off safety belts to 4 x 4 supports which were about two feet from the edge, though Luke M. Linscott, one of Rodgers' carpenters, testified he wouldn't trust his life to these supports (Tr.39). It was possible to tie

off to other supports with the use of 12-foot lifelines, which were available and sometimes used in other operations (Tr.26,33).

Safety belts have been required for the erection of a guardrail on an open-sided roof or floor. Bevo Insulation & Roofing Co.,81 OSAHRC 108/E6, 1982 CCH OSHD ¶25,851 (No. 81-1015, 1981) (Schwartz, J.): Peck & Hiller Co., 80 OSAHRC 52/C1 8 BNA OSHC 1740, 1980 CCH OSHD ¶24,508(No. 79-3189, 1980) (Brennan, J.). It stands to reason that employees removing a guardrail are equally in need of protection.

Rodgers is presumed to have knowledge of this violation because of the long-standing practice and because its foreman, Stephens, participated. His knowledge is imputable to Rodgers. Ocean Electric Corp., 75 OSAHRC 6/C14, 6 BNA OSHC 1030, 1975-76 CCH OSHD ¶20,167 (No. 5811, 1975).

The next issue is whether the Secretary has met the "reasonable person" test laid down by the Commission in S & H Riggers & Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1263, 1979 CCH OSHD ¶23,480, P. 28,436 (No. 15855, 1979), rev'd 659 F.2d 1273 (5th Cir. 1981). There the Commission said that, in order to establish a §1926.28(a) violation the Secretary must prove, among other things, that

> a reasonable person familiar with the factual circumstances surrounding the allegedly hazardous conditions, including any facts unique to a particular industry, would recognize a hazard warranting the use of personal protective equipment.

In reversing the Commission in S & H Riggers, the 5th Circuit said,

> [I]n order to sustain a citation under this regulation, the Secretary bears the burden of proving either that the employer failed to provide personal protective equipment to its employees under circumstances in which it is the general practice in the industry to do so or that the employer had clear actual knowledge that personal protective equipment was necessary under the circumstances.

(Emphasis supplied.) 659 F.2d at 1285.

The Commission has not receded from its position. See Daniel Construction Co., 82 OSAHRC _____, 10 BNA OSHC 1549, 1982 CCH OSHD ¶26,027, p. 32,671 (No. 16265, 1982). The Commission's judges are bound by Commission precedent, even in a circuit which is contra. Grossman Steel & Aluminum Corp., 76 OSAHRC 54/D9, 4 BNA OSHC 1185, 1975-76 CCH OSHD ¶20,691 (No. 12775, 1976).

Here neither the Secretary nor Rodgers introduced evidence regarding industry practice or whether a reasonable person familiar with the circumstances would recognize the hazard. However, in S & H Riggers the Commission found a violation where employees were working near the unguarded edge of the 4th floor of a building without fall protection and were thus exposed to "an obvious fall hazard." P.28,439 of CCH OSHD. Here the fall hazard was equally as obvious.

Rodgers also contends that any violation of §1926.28(a) by Stephens and Wright was an isolated incident, or unpreventable employee misconduct.

Unpreventable employee misconduct is an affirmative defense wherein the employer bears the burden of proving that the actions constituting non-compliance with the standard were (a) unknown to the employer and (b) contrary to both the employer's instructions and a company work rule which the employer has uniformly enforced. Weatherhead Co., 76 OSAHRC 61/E7, 4 BNA OSHC 1296, 1976-77 CCH OSHD ¶20,784 (No. 8862, 1976).

"Work rule" was further defined in J. K. Butler Builders, Inc., 77 OSAHRC 26/A2, 5 BNA OSHC 1075, 1977-78 CCH OSHD ¶21,585 (No. 12354, 1977), as

> . . .an employer directive that requires or proscribes certain conduct, and that is communicated to employees in such a manner that its mandatory nature is made explicit and its scope clearly understood.

Additionally, the work rule must be the equivalent of the standard the respondent is accused of violating. Kansas Power & Light Co., 77 OSAHRC 39/A2, 5 BNA OSHC 1202, 1977-78 CCH OSHD ¶21,696 (No. 11015, 1977).

Rodgers contends in its brief (p.4) that its safety booklet (Exhibit R-1) "requires the wearing and tieing off of safety belts when working at heights." It does not, however, point out the precise rule it refers to, and the only one bearing on the subject appears to be the following:

> 33. No employee shall work on scaffolding higher than ten feet without proper guard rails, toe boards and proper flooring except when proper precautions such as lifelines with harnesses, barricades, etc. have otherwise been made. Scaffold platforms should be at least forty-eight inches wide when possible.

This "work rule" is hardly the equivalent of the standard allegedly violated. It pertains primarily to guardrails on scaffolds [6] and applies "except when proper precautions such as lifelines with harnesses, barricades, etc. have otherwise been made." Not only is this not a work rule here applicable, but it makes improper exceptions even as it applies to guardrails.

In addition, there is no evidence of the communication of this purported work rule, or of any specific instructions on the use of safety belts, to Stephens and Wright, except that a copy of the safety booklet was given to new employees (Tr.180). Also, evidence regarding enforcement of the claimed rule is very sparse. Assistant Superintendent Swain testified that he reprimanded one employee for a safety belt violation (Tr.193), and Crane Operator Roger Choate said he had told another one to use his belt (Tr.169).

---

[6] The structure here involved was decking for a floor, not a scaffold, though Rodgers' brief refers to it as the latter.

The very fact that a supervisory employee, Stephens, saw fit to violate the purported rule can be taken as evidence that it was not effectively communicated or enforced. United Geophysical Corp., 81 OSAHRC 77/D6, 9 BNA OSHC 2117, 1981 CCH OSHD ¶25,579 (No. 78-6265, 1981).

Rodgers introduced into evidence a number of minutes of "tool box" safety meetings, but, significantly, none of them dealt with the topic of safety belts until after the fatal accident. See Exhibit R-28, dated April 21, 1982, and Exhibit R-29, dated April 28, 1982.

I find this violation proved and that it was serious under §17(k) of the Act in that there was a substantial probability that death or serious physical harm could result therefrom.

B.

Subitem 1b of citation 1, as amended, Docket No. 82-0503, alleges another violation of §1926.28(a) and/or §1926.105(a). While investigating the Stephens fatality, Compliance Officer Slagle saw a Rodgers employee, Vernon Trailer (sic), clinging to the top of an 8-foot-high column form on the edge of the 10th floor while he released concrete into the form from a bucket suspended from a crane (Tr.49,52). He then saw another Rodgers employee, Jeff Flanagan, climb the form and use a vibrator on the freshly-poured concrete (Tr.52). Neither employee had any form of fall protection, though a safety belt and lanyard could have been tied off to the reinforcing steel ("rebars") protruding from the top of the form (Tr.54). Other forms of fall protection, such as a safety net, scaffold, catch-platform or temporary floor, would have been impractical, and a ladder would have been equally as dangerous as the method employed, Slagle testified (Tr.53,54).

When Slagle called attention to Flanagan's situation atop the form,

Dennis E. Gee, Rodgers' project superintendent, who was with Slagle on the walkaround, had another employee get a safety belt for Flanagan and ordered the latter to tie off (Tr.57,58).

Flanagan and Gee testified about this incident substantially as did Slagle, but they differed somewhat with each other. Flanagan, a general laborer who went to work for Rodgers in January 1982, testified that he started using the vibrator about a week after he was hired, that he didn't use a safety belt when on top of the forms because he had observed others using the vibrator without using safety belts, that the carpenters had the belts and others had to borrow them when they needed them (there not being enough to go around), and that after the OSHA inspection he wore a safety belt when he could get one (Tr.62-68). Flanagan also testified that when Trailer tripped the concrete bucket to fill the forms he used no safety belt and rode the bucket from one form to another (Tr.66,67).

Gee testified that Flanagan was basically a scando (personnel-hoist) operator, that he was issued a safety belt, that he later became a laborer, that he usually worked at ground level, and that he was not supposed to be on the column where Slagle saw him (Tr.140-144).

Swain, Rodgers' assistant superintendent who also had safety duties, testified that they tried to keep Flanagan on the ground or on the scando, that he probably operated the vibrator atop the column at the time of the inspection because a number of employees walked off the job temporarily after Stephens' death, that he (Swain) did not know Flanagan was on the vibrator job, and that his being there without a safety belt was "an isolated instance" (Tr.191). He said that Trailer had previously been reprimanded for failure to wear a safety belt (Tr. 193).

Rodgers does not argue that Flanagan and Trailer did not need safety belts when atop the column. Instead, it attacks Flanagan's credibility and seeks to make out a defense of unpreventable employee misconduct, the elements of which have already been discussed.

Here again, Rodgers has failed to prove the elements of this affirmative defense. It has not established that it had a work rule on this subject which was effectively communicated and implemented. There is evidence that both Flanagan and Trailer were told at least once each to wear safety belts (Tr. 169,193), but this hardly suffices to establish the elements of this defense.

Rodgers contends that Flanagan was not authorized by any supervisor to work on the column where he was at the time of the inspection. It says nothing, however, about Trailer, who was seen by Reina on the same column without a safety belt before Flanagan climbed it. Also, when the testimony of Gee and Swain is analyzed it fails to establish that Flanagan disobeyed any orders in being where he was. Gee said he wasn't aware that Flanagan was on the column and that Trailer (who was not a foreman) probably brought him up there due to a shortage of personnel after the fatal accident (Tr.142). Swain testified that Flanagan "seldom went up top," that Flanagan's presence there was probably due to the shortage of personnel mentioned by Gee, that he didn't know Flanagan was there until he walked up with the inspector, and that "to my knowledge" no supervisor knew Flanagan was up there on the column (Tr.191-192).

Apparently Flanagan was not told not to work on the column when we was discovered there during the inspection; he was only ordered to put on a safety belt. This further indicates that he was not violating any orders by being there.

To the extent that Flanagan's testimony contradicted that of Gee and Swain, I credit Flanagan's because he had less to gain and more to lose than did the supervisory employees. Also, Flanagan's testimony coincides more with the known facts, including the instances in which Rodgers employees exposed to fall hazards either had no safety belts or did not tie off.

At most, Gee's and Swain's testimony might tend to prove lack of employer knowledge of the violative condition as far as Flanagan is concerned, but there is no doubt but that Trailer was where he was supposed to be.

There is a presumption that the employer knew or in the exercise of reasonable diligence could have known of violative conditions which existed at the time of the inspection and were readily discernible. Weatherhead Co., supra. This presumption has not been rebutted by Rodgers.

What has been said above about the "reasonable person" test applies here. There was an obvious fall hazard, and a reasonable person familiar with the circumstances would recognize it as such. There was a substantial probability that death or serious physical harm could result from a 10-story fall, so the violation was serious.

C.

Item 1 of citation 2, (Docket No. 82-0504), as amended at the beginning of the hearing, alleges a nonserious violation of §1926.28(a) and/or §1926.105(a). At the close of the hearing, the Secretary moved to amend this item again to allege that the violation was serious rather than nonserious (Tr.205). Rodgers objected strenuously .(Tr.207) The motion was taken under advisement.(Tr.221)

In view of the disposition to be made of this item, the amendment issue is unimportant. However, for the record in the event of a reversal, I find and conclude that the amendment should be allowed.

The motion was based on Rule 15(b), F.R.Civ. P. [7] to conform the pleadings to the evidence, which showed that there was a hazard of a 6-floor fall which probably would result in multiple, severe injuries (Tr.98,99). This evidence was introduced without objections.

Rodgers objected to the motion on the grounds that the proposed amendment was too late, that additional evidence is required to prove a serious violation, that it was not prepared to meet a serious citation, and that it would have subpoenaed a former employee involved in this item had it known that a serious violation would be charged. The hearing was reopened (Tr.210) to allow Rodgers to introduce any evidence it had available that would be made pertinent by this amendment. Over the Secretary's objecton, Rodgers was allowed to introduce evidence on the existence as well as the characterization of the alleged violation. The record was then closed, with leave to Rodgers to move to reopen should it discover additional pertinent evidence on this item.

Rodgers has not sought leave to reopen the record to introduce additional evidence.

---

[7] Rule 15(b), F.R. Civ. P., provides:

> Amendments To Conform To The Evidence. When issues not raised by the pleadings are tried by express or implied consent of the parties, they shall be treated in all respects as if they had been raised in the pleadings. Such amendment of the pleadings as may be necessary to cause them to conform to the evidence and to raise these issues may be made upon motion of any party at any time, even after judgment; but failure so to amend does not affect the result of the trial of these issues. If evidence is objected to at the trial on the ground that it is not within the issues made by the pleadings, the court may allow the pleadings to be amended and shall do so freely when the presentation of the merits of the action will be subserved thereby and the objecting party fails to satisfy the court that the admission of such evidence would prejudice him in maintaining his action or defense upon the merits. The court may grant a continuance to enable the objecting party to meet such evidence.

Under the circumstances of this case, a sua sponte posthearing amendment by the judge would have been in order. Rodney E. Fossett, dba Southern Lightweight Concrete Co., 79 OSAHRC 92/D2, 7 BNA OSHC 1915, 1979 CCH OSHD ¶23,989 (No. 76-3944, 1979). Therefore, there is no reason for denying the Secretary's motion to amend made at the close of the hearing, especially since Rodgers was allowed to reopen its case in chief and given leave to move for a supplemental hearing. Its argument that it would have subpoenaed a former employee to testify if it had known the citation would be amended to allege a serious violation is therefore without merit.

Compliance Officer Reina saw an "eyebrow", or materials catch platform, being built on the perimeter of the 6th floor to protect masons and others working below from falling materials. This eyebrow was constructed of 4 x 4 timbers spaced 8 to 10 feet apart and extending about 8 feet beyond the perimeter and with plywood sheets nailed to the 4 x 4s to make a platform (without guardrails) (Tr.94-99). At Reina's request, Ray Foster, a Rodgers employee identified as being in charge of this work, demonstrated how the plywood sheets were pushed out onto the 4 x 4s and nailed in place (Tr.96). Foster had no form of fall protection. Reina testified that a safety belt and lifeline could have been used and that a ladder, scaffold, safety net or catch platform would not have been practical.

Superintendent Gee testified that Foster, whom he characterized as a "safety man", was in charge of building this eyebrow with a carpenter and a helper doing the actual work; that at the time of the inspection the eyebrow was complete and that neither Foster nor anyone else went out on the eyebrow at that time; but that he did not hear the conversation between Reina and Foster (Tr.211-214).

Rodgers contends that during the inspection nobody went out on the eyebrow and that if Foster did so it was at Reina's suggestion so it should not be held responsible. Since Gee did not hear the Reina-Foster conversation, it is possible that he did not see Foster demonstrate the method of fastening the plywood to the 4 x 4s. There is no reason to doubt Reina's testimony that Foster did so without fall protection, but it is significant that Reina did not ask Foster about his usual practice with regard to the use of safety belts in this operation. Under these circumstances, the violative conduct may have been induced unwittingly by the compliance officer. Therefore, the citation will be vacated.

However, in the event this disposition should be found to be erroneous, I find that the practice of nailing the plywood sheets to the 4 x 4 beams without the use of safety belts is an obvious hazard which a reasonable person familiar with the circumstances would recognize as such. Cf. Tri-State Roofing & Sheet Metal, Inc., v. OSHRC, 4th Cir. #81-1778, June 21, 1982, 1982 CCH OSHD ¶26,173. I also find that Foster's knowledge is imputable to Rodgers.

D.

Section 17(j) of the Act requires the Commission, in assessing penalties, to consider the gravity of the violation and the employer's size, good faith and history of previous violations. These factors need not be accorded equal weight, but the gravity is usually of greater significance than the others. Colonial Craft Reproductions, 72 OSAHRC 11/B10, 1 BNA OSHC 1063, 1971-73 CCH OSHD ¶15,277 (No. 881, 1972). Elements to be considered in determining gravity include the number of employees exposed to the risk of injury, duration of the exposure, precautions taken against injury, and the degree of

probability of occurrence of an injury. National Realty & Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 95,1972) rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

The Secretary has proposed an aggregate penalty of $490 for the two serious violations of §1926.28(a) alleged in Docket No. 82-0503. On balance, after considering the statutory criteria, I find $490 to be an appropriate penalty.

III. The alleged serious violation of §1926.451(m)(6).

Item 1 of citation 1 (Docket No. 82-0504) alleges a serious violation of §1926.451(m)(6) [8] in that the open ends and sides of a carpenter's bracket scaffold on the 10th floor did not have standard guardrails and toeboards.

Actually, the evidence shows that the scaffold in question had a guardrail on the open side but not the ends. Compliance Officer Reina so testified (Tr.80-82). A photograph introduced by Rodgers, Exhibit R-53, shows this scaffold or a similar one.

William C. Pollack, Jr., who was a carpenter employed by Rodgers at the time of the inspection (but not at the time of the hearing), was called as a witness by the Secretary and testified that this scaffold had had guardrails on the ends at one time but that they interfered with access to the scaffold and were removed a month or so before the inspection (Tr.111,112). This scaffold was used when exterior walls were poured and was moved up from floor to floor as needed.

Rodgers says at p.11 of its brief, "Mr. Pollack also testified that

---

[8] The cited standard provides:

§1926.454(m) Carpenters' bracket scaffolds

* * *

(6) Guardrails made of lumber, not less than 2 x 4 inches (or other material providing equivalent protection), approximately 42 inches high, with a midrail, of 1 x 6 inch lumber (or other material providing equivalent protection), and toeboards, shall be installed at all open sides and ends on all scaffolds more than 10 feet above the ground or floor. Toeboards shall be a minimum of 4 inches in height. Wire mesh shall be installed in accordance with paragraph (a)(6) of this section.

at any previous time that any employee had been on the scaffold, they [sic] wore tied-off safety belts. Thus, there have been absolutely no demonstration of employee exposure to any hazard here", citing Humphreys & Harding, Inc., 74 OSAHRC 28/C2, 1 BNA OSHC 1700, 1973-74 CCH OSHD ¶17,784 (No. 621, 1974). I do not so read Pollack's testimony nor is Humphreys & Harding pertinent.

Pollack's testimony about the use of safety belts is ambiguous. He testified (Tr. 112) that the guardrail was removed from one end for access, and when asked about the other end he replied,

> No, there is no brackets there. We need—they are really in the way. You know, I'm saying they should have been there, and we needed access. We tied our safety belts on so we could get around up there and we just took them off so we could get to the nuts and bolts that were outside the end of that.

Pollack did not, as Rodgers asserts, testify that any employee on the scaffold wore a tied-off safety belt. Also, it is unclear whether he meant the guardrail or the safety belts were removed to get to the nuts and bolts.

In any event, Rodgers has not proved, and does not contend it has proved, the affirmative defense of impossibility of compliance, and safety belts are not a substitute for guardrails. Warnel Corp., 76 OSAHRC 41/C6, 4 BNA OSHC 1034, 1975-76 CCH OSHD ¶20,576 (No. 4537, 1976).

In view of the length of time the scaffold had been used without guardrails, Rodgers is chargeable with constructive knowledge of the violative condition. Also, it appears that Assistant Superintendent Swain was aware of it (Tr.189-190).

Rodgers contends that the citation must be vacated because the Secretary did not prove that the violative condition existed on the inspection date,

the compliance officer did not see any employee on the scaffold, and information obtained from an employee is insufficient to establish employee exposure, citing Mel Jarvis Construction Co., Inc., 9 BNA 2123, (No. 77-207, 1981). (Carlson, J.)

It is not necessary that the violation occur on the inspection date or that it be observed by the compliance officer. Circle Industries Corp., 76 OSAHRC 121/F4, 4 BNA OSHC 1724, 1976-77 CCH OSHD ¶21,119 (No. 4356, 1976). However, the violative condition (absence of guardrails) did exist on the inspection date. The question is one of access to the hazard. Circle Industries, supra. Here there definitely was access. Rodgers' reliance on Mel Jarvis, supra, is misplaced. There an employee's hearsay representation of exposure to the compliance officer was held insufficient by the judge. Here the employee came to the hearing and testified. Moreover, hearsay is admissible in our proceedings. United Technologies, Power Systems Div., 81 OSAHRC 40/C13, 9 BNA OSHC 1813, 1981 CCH OSHD ¶25,350 (No. 79-1552, 1981).

In view of the potential 10-floor fall and Compliance Officer Reina's testimony regarding the likely consequences thereof (Tr.81), I find the violation to be serious.

Under the statutory criteria previously discussed, I find a penalty of $300 to be appropriate rather than the $490 proposed by the Secretary.

IV. The alleged serious violation of 29 CFR 1926.550(a)(4).

Item 2 of citation 1 (Docket No. 82-0504) alleges a serious violation of §1926.550(a)(4) and "the applicable ANSI standard for the type of crane or derrick in use" in that "inappropriate hand signals" were given to a crane operator in the center of the 11th floor of the building.

The cited standard provides:

> Hand signals to crane and derrick operators shall be those prescribed by the applicable ANSI standard for the type of crane in use. An illustration of the signals shall be posted at the job site.

The Secretary introduced into evidence, without objection from Rodgers, excerpts from ANSI B30.3-1975, American National Standard, Hammerhead Tower Cranes, §3-3.3.2 of which (Exhibit C-6) provides:

> Hand signals shall be in accordance with Figure 4 [Exhibit C-7] and shall be posted conspicuously.

Compliance Officer Reina testified that, while he was on the 11th floor talking to two employees, someone tapped him on the shoulder (he was in a bent-over position) and pointed to a concrete bucket suspended over his head on the hammerhead crane's hoisting line. Reina perceived this as a life-threatening situation. He testified (Tr.85) that two non-English speaking employees (apparently the two with whom he had been conversing) were giving the crane operator improper hand signals which he characterized as mere "motions" indicating the desired direction of movement.

The crane was being operated by remote control, and the operator, Roger Choate,was located on the edge of the 11th floor. Choate testified (Tr.157-165) that he knew he was supposed to lower the concrete bucket between the two employees and that he could see them but not Reina who was behind a column. Choate's testimony is somewhat conflicting within itself, but at one point he conceded that the two employees simply indicated by pointing down or up when they wanted him to lower or raise the bucket. According to Exhibit C-7 (and also Rodgers' Exhibit R-51, which apparently was taken from a different ANSI standard) the correct signal for such a maneuver is to point down or up, as the case might be, making a circular motion with the fore-finger of the right hand. Thus it appears from both charts (Exhibit C-7 and

and R-51) that improper hand signals were given by the two employees.

However, the matter does not end there. ANSI B30.3-1975 was not in existence when §1926.500(a)(4) was promulgated in 1972 (37 FR 243, December 16, 1972, p. 27545) and a subsequently-promulgated standard is not automatically incorporated. Clifford B. Hannay & Son, Inc., 78 OSAHRC 12/A2, 6 BNA OSHC 1336, 1978 CCH OSHD ¶22,525 (No.15983, 1978). Reference must therefore be made to the predecessor standard, ANSI B30.3-1975,on the cover of which is a notation that it is a partial revision of B30.2-1943(R.1952), ¶3021 of which provides:

> Signals to the operator shall be in accordance with the standards set forth in Pars. 3022, 3023, and 3024. Whistle signals may be used only when a single crane is in operation. A mechanical or electric gong is recommended in preference to a whistle. A copy of the signals in use shall be posted in a conspicuous place on or near the crane or derrick.

Paragraphs 3022 and 3023 provide for either one-hand signals or two-hand signals, including the following

> 3022 One-Hand Signals
>
> * * *
>
> (1) Hoist. With forearm vertical, forefinger pointing up, move hand in small horizontal circle.
> (2) Lower. Arm extended, palm down, wave hand down and up.
>
> 3023 Two-Hand Signals
>
> * * *
>
> (11) Hoist. Hold both arms horizontal at sides, fully extended, and move upward and return.
> (12) Lower. Hold both arms at sides, fully extended, and move out and return.

For swinging the boom, ¶3022 provides:

> Arm extended, point with finger in the direction of motion.

It will be seen from these examples that the 1975 revision makes some changes in the prescribed signals, although the one-hand signal for "hoist" remains the same. It is also apparent that the two employees gave the correct signal for swinging the boom. Nevertheless, they gave improper hand signals to raise and lower the load.

However, that still does not end the matter. The next question is whether Rodgers, as general contractor, has the responsibility of seeing to it that all the subcontractors' employees who give signals to its crane operator employ the prescribed signals.

At the time of the inspection, there were 7 or 8 subcontractors on the job (Tr.76), and Rodgers had about 30 employees there (Tr.151). Rodgers provided the crane and two operators (Tr.156). Anyone could give signals; no employees were specifically designated for this purpose (Tr.92). At the time of the inspection, 6 to 8 employees of a cement finishing subcontractor, Terry J. Fricks, were working a concrete slab being poured on the 11th floor (Tr. 84), and it was two of Fricks' employees who gave the signals complained of by Reina.

Choate, the crane operator on duty at the time, testified for Rodgers. He testified that the hand signal chart introduced as Exhibit R-51 was posted on the bulletin board at Rodgers' job office (Tr.155) and conceded on cross examination he made no effort to find out if the two Fricks employees knew these hand signals (Tr.174).

As previsouly noted, Exhibit R-51 is not the set of signals prescribed by ANSI B30.2-1943 (R.1952),¶¶3021-3024. Also, ¶3021, quoted above, provides that "[a] copy of the signals in use shall be posted in a conspicuous place

on or near the crane or derrick", not in the jobsite office. Thus Rodgers posted the wrong signals in the wrong place and apparently did nothing else to insure that its own employees or those of subcontractors knew and used the appropriate signals. This is something a general contractor, in its supervisory capacity, is in a position to control. Knutson Construction Co., 75 OSAHRC 131/F3, 4 BNA OSHC 1759, 1976-77 CCh OSHD ¶21,185 (No. 765, 1976).

Just how much the general contractor can be expected to do is less clear. However, under the standard it should at least post the correct signals on or near the crane. It also seems to me that a general contractor should require all its employees who signal the crane operator to demonstrate proficiency in giving these signals and should request all subcontractors to do likewise.

I find this violation proved, and the next question is whether the violation is serious as charged.

Although the compliance officer characterized the violation as serious, I find it to be nonserious. The crane operator was not in his lofty perch on the crane but was operating it by remote control from a short distance away. The chances of mistaking a hand signal and dropping a load on someone were minimal. Therefore, no penalty will be assessed.

V. The alleged nonserious violation of §1926.350(j) and ANSI Z49.1-1967, §3.2.4.3.

Item 2 of citation 2 (Docket No. 82-0504), as amended, alleges a nonserious violation of §1926.350(j) [9] and ANSI Standard Z49.1-1967, §3.2.4.3, [10] in that

---

9 The cited standard, under subpart J, Welding and Cutting, provides:

§1926.350(j) Additional rules

For additional details not covered in this subpart, applicable technical portions of American National Standards Institute, Z49.1-1967, Safety in Welding and Cutting, shall apply.

10 The cited ANSI standard provides:

§3.2.4.3 Oxygen cylinders in storage shall be separated from fuel-gas cylinders or combustible materials (especially oil or grease), a minimum distance of 20 feet or by a noncombustible barrier at least 5 feet high having a fire-resistance rating of at least 1/2 hour.

oxygen and fuel-gas cylinders were stored together in the center of the 6th floor.

Compliance Officer Reina's uncontradicted testimony (Tr.100-105) establishes that an oxygen cylinder and an acetylene cylinder were stored about 2 inches apart, with no wall between them, about 20 feet from a stairwell used by Rodgers' employees and the same distance from a Rodgers employee who was working in the area, posing a hazard of fire and explosion.

In the exercise of reasonable diligence, Rodgers could have known of this violative condition. I find this item proved.

VI. The alleged violation of §1926.602(a)(9)(i).

Item 3 of citation 2 (Docket No. 82-0504) alleges a nonserious violation of §1926.602(a)(9)(i) [11] in that a Ford 445 front end loader, a bidirectional earthmoving machine, was not equipped with an operable horn.

Here again, Compliance Officer Reina's testimony is uncontradicted. It establishes that a front-end loader, capable of moving in either direction, and operated by a Rodgers employee, was equipped with a horn which was not in an operating condition (Tr.105-108). Reina quoted the driver as saying that the horn had not been operational in the 2 or 3 weeks he had driven the loader (Tr.106). One Rodgers employee was walking alongside the loader to direct it, and there were several other persons in that general area (Tr. 107-108). The hazard was that an employee might have been struck or run

---

[11] The cited standard provides:

§1926.602-MATERIAL HANDLING EQUIPMENT

(a) Earthmoving equipment; general

* * *

(9) Audible alarms

(i) All bidirectional machines, such as rollers, compactors, front-end loaders, bulldozers, and similar equipment, shall be equipped with a horn, distinguishable from the surrounding noise level, which shall be operated as needed when the machine is moving in either direction. The horn shall be maintained in an operative condition.

over by the loader (Tr.108).

In the exercise of reasonable diligence, Rodgers could have known of this violation.

FINDINGS OF FACT

1. Rodgers is a corporation organized, and with headquarters in, the state of Tennessee, has a place of business in Texas, and at the time of the inspections herein was engaged as general contractor in the construction of a Hilton hotel in Arlington, Texas, the job superintendent on which project made frequent reports to Rodgers' Tennessee headquarters.

2. On March 1, 1982, Rodgers' carpenter foreman, Dennis E. Stephens, was killed and Bobby Wright, his helper, was injured when floor decking on the 9th floor collapsed, due to removal of supports, as they prepared to remove guardrails. Neither Stephens nor Wright was tied off, though Stephens was wearing a safety belt. It was standard operating procedure for guardrails to be removed without fall protection. Use of safety belts was feasible, but use of ladders, scaffolds, catch platforms, temporary floors or safety nets was not practical. Rodgers knew or in the exercise of reasonable diligence could have known of this violation, and Stephens' knowledge is imputable to Rodgers. There was a substantial probability that death or serious physical injury could result from this violation.

3. While investigating the Stephens fatality, the compliance officer saw two Rodgers employees, Vernon Trailer and Jeff Flanagan, climb an 8-foot column form on the periphery of the 10th floor without any fall protection, Trailer to release concrete from an overhead bucket into the form and Flanagan to use a vibrator on the freshly-poured concrete. Use of safety belts was feasible, since they could have been tied off to the rebars,

but use of ladders, scaffolds, catch platforms, temporary floors, safety lines or safety nets was impractical. The performance of the operations in which Trailer and Flanagan were engaged without safety belts was a common practice, and in the exercise of reasonable diligence Rodgers could have known about it. Rodgers did not supply safety belts to all its employees, and they frequently had to borrow safety belts from each other. There was a substantial probability that death or serious physical injury could result from this violation.

4. A reasonable person familiar with the circumstances would have recognized the hazards found in findings of fact Nos. 2 and 3.

5. Rodgers has not established its affirmative defense of unpreventable employee misconduct to either of the violations found in findings of fact Nos. 2 and 3.

6. The proposed penalty of $490 for the violations found in findings of fact Nos. 2 and 3 is appropriate.

7. A materials catch platform,or "eyebrow", was being erected on the perimeter of the 6th floor, and at the request of a compliance office a Rodgers employee, Ray Foster, who was in charge of this operation, demonstrated, without fall protection, how plywood sheets were pushed out onto 4 x 4s projecting about 8 feet beyond the floor's edge and nailed in position. There is evidence that this work was being done without safety belts or other form of fall protection prior to the demonstration by Foster, and the compliance officer may have unwittingly induced a violation.

8. There were no guardrails on the open ends of a carpenter's bracket scaffold on the 10th floor. This scaffold was used in the pouring of exterior walls and was moved up from floor to floor as needed. It had formerly

had end rails, but they were removed a month or more before the inspection because they interfered with access to the scaffold and nuts and bolts underneath it. In the exercise of reasonable diligence, Rodgers could have known of this violation. There was a substantial probability that death or serious physical harm could result from this violation. A penalty of $300 is appropriate.

9. The compliance officer observed two employees of a cement-finishing subcontractor, Terry J. Fricks, using inappropriate hand signals to Rodgers' crane operator for movement of a concrete bucket. Rodgers had 30 employees on this job, and there were 7 or 8 subcontractors. Rodgers posted an illustration of hand signals to crane operators in the job office but not on or near the crane, which was a hammerhead tower crane, and the signals so posted were not those incorporated by reference by §1926.500(a)(4). Rodgers made no other efforts to insure that persons giving signals to the crane operator used approved signals. The violation was nonserious, and no penalty shall be assessed.

10. Rodgers stored an oxygen cylinder and an acetylene cylinder about 2 inches apart, with no wall between them, about 20 feet from a 6th floor stairwell used by Rodgers employees. One Rodgers employee was working in this area and was exposed to the hazard of fire and explosion. Rodgers knew or in the exercise of reasonable diligence could have known of this violation.

11. A bidirectional front end loader, an earthmoving machine, had an inoperable horn. At least one Rodgers employee was exposed to the hazard of being struck or run over. The condition had existed at least 2 weeks. Rodgers knew or in the exercise of reasonable diligence could have known of this violation.

## CONCLUSIONS OF LAW

1. Rodgers at all times material hereto was engaged in a business affecting commerce within the meaning of §3(5) of the Act.

2. Rodgers at all times material hereto was subject to the requirements of the Act and the standards promulgated thereunder.

3. Rodgers violated §5(a)(2) of the Act by committing violations of the following standards:

Docket No. 82-0503 -

§1926.28(a) (two serious violations)

Docket No. 82-0504 -

§1926.451(m)(6) (serious)

§1926.350(j) and ANSI Z 49.1-1967, §3.2.4.3. (nonserious)

§1926.550(a)(4) and ANSI B 30.2 1943(R.1952), ¶3021 (nonserious)

§1926.602(a)(9)(i) (nonserious)

4. Rodgers was not in violation of §1926.28(a) and/or §1926.105(a) as alleged in item 1 of citation 2 (Docket No. 82-0504).

## ORDER

On the basis of the foregoing discussion and opinion, findings of fact, and conclusions of law, it is ORDERED that:

1. Item 1 of citation 1, as amended (Docket No. 82-0503), alleging serious violations of 29 CFR 1926.28(a) and/or §1926.105(a), is AFFIRMED insofar as it alleges violations of §1926.28(a), and a penalty of $490 is ASSESSED.

2. Item 1 of citation 1 (Docket NO. 82-0504), alleging a serious violation of 29 CFR 1926.451(m)(6), is AFFIRMED and a penalty of $300 is ASSESSED.

3. Item 2 of citation 1 (Docket No. 82-0504) alleging a serious violation

of 29 CFR 1926.550(a)(4) and ANSI B 30.2-1943 (R.1952),§§2031-3024, is AFFIRMED as a nonserious violation.

4. Item 1 of citation 2, as amended (Docket No. 82-0504), alleging a serious violation of 29 CFR 1926.28(a) and/or §1926.105(a) is VACATED.

5. Item 2 of citation 2, as amended (Docket No. 82-0504), alleging a nonserious violation of 29 CFR 1926.350(j) and ANSI Z 49.1-1967, ¶3.2.4.3, is AFFIRMED.

6. Item 3 of citation 2 (Docket No. 82-0504),alleging a nonserious violation of 29 CFR 1926.602(a)(9)(i), is AFFIRMED.

DEE C. BLYTHE

DECISION

Before: ROWLAND, Chairman; CLEARY, Commissioner.*/

BY THE COMMISSION:

A decision of Administrative Law Judge William E. Brennan is before the Commission for review pursuant to section 12(j)1/ of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 (the "Act"). In his decision, Judge Brennan ruled on the issues raised in five separate citations issued by the Secretary of Labor (the "Secretary") after the Secretary's inspection of United States Steel Corporation's ("USS") coke oven facility at Fairless Hills, Pennsylvania. The inspection began on March 22, 1977, two months and two days after the effective date

*/ Commissioner Cottine took no part in the consideration or decision of this case.

1/ 29 U.S.C. § 661(i).

of the coke oven emissions standard at 29 C.F.R. § 1910.1029. The citations issued as a result of the inspection mainly contain allegations of noncompliance with that standard. The judge affirmed nearly all the cited instances of alleged noncompliance and assessed penalties totaling $33,250. We affirm in part and reverse in part, as outlined below.

I

Coke is a porous, cellular by-product of the destructive distillation or carbonization of coal.[2/] It is used primarily by the steel producing industry as a fuel for its blast furnaces and foundries. A coke oven battery is a large, generally rectangular structure, typically 200 or more feet long, 40 to 60 feet wide, and up to 50 feet in height. The battery is divided by refractory brick walls into a series of narrow ovens or coking chambers, about 18 inches wide and from 13 to 20 feet high, extending the full width of the battery and separated from the adjoining ovens by a heating chamber. Heating and oven chambers alternate with each other so that there is a heating chamber on either side of an oven. This heating process causes the carbonization of the coal within the ovens and results in the production of coke and various distillates.

Coke production consists of three basic operations: "charging," "coking," and "pushing." The charging cycle begins with the loading of coal into the individual ovens to a predetermined level (the coal line) which allows free space above the coal so that the gases may be removed from the oven and collected. This charging procedure is done with the use of a large, mechanical "larry car" which operates on rails on the

---

2/ This description of the coke production process is largely taken from the judge's decision and from the preamble to the coke oven emissions standard. 41 Fed. Reg. 46742-44 (1976).

top of the battery. The larry car has three or four hoppers which are fed a premeasured load of coal obtained from a coal bunker located at the end of the battery. The number of hoppers in a larry car corresponds to the number of charging holes in the roof of the ovens. The loaded larry car moves away from the coal bunker and is positioned over the oven to be charged. The charge hole lids are removed and the larry car hoppers are emptied into the oven through its charging holes. After the coal is in the oven, a small door called a "chuck" door, is opened through which a leveler ram is inserted into the oven to level the coal within the predetermined coal line. During this charging process, the oven is placed under steam "aspiration" (forced or induced draft) by the use of steam jets located in vertical pipes called standpipes. This aspiration system is designed to induce a draft within the oven to increase the exhausting effect and thus reduce or limit the escape of volatile gases from the oven into the ambient air during the charging process and is called "charging on the main." The gases are removed from the ovens through the vertical standpipes and through "gooseneck" pipes to one or two large, horizontal ducts called "collector mains." After the charging is completed, the charging lids and chuck doors are closed, the aspiration is shut off and the "coking" operation begins.

There are a number of variables which determine the desired coking time, such as width of the ovens, the ovens' condition, coal moisture, and the nature of the coal used. The time varies from about 16 to 20 hours. Coking time is selected so that the coke adjacent to the oven walls has a temperature from 1900° F. to 2000° F. The heating chamber temperatures range from about 2600° F. to 2800° F.

When the coal is sufficiently coked, doors on each side of the oven, known as the "push side doors" and "coke side doors," are removed by mechanical door machines (the door machines run on rails at what is called the "bench level" of the battery). With both doors removed, a mechanically operated ram, mounted on a pusher door car, pushes the incandescent coke out through the coke side of the oven into a large boxcar called a "quench car". The coke-filled quench car then moves on rails to the quench tower where the coke is cooled with water and then dumped onto the coke wharf. When the oven doors are put back onto the oven, the procedure begins over again.

At Fairless Hills, USS maintains a steel mill which includes coke oven batteries numbered 1 and 2. The batteries were built in 1952 and were manufactured by the Wilputte Company. Each battery consists of 87 coke ovens. The ovens are each 12 feet 2 inches high, 40 feet 7-5/8 inches long and 18 inches wide. Each oven has three charging holes. Approximately 16 tons of coal are dropped into each oven and heated to an average temperature of 2000° F. The average coking time at the time of the OSHA inspection was 16-1/2 hours.

USS's ovens are operated 24 hours a day, seven days a week and are manned by three eight-hour shifts, called "turns," of coke oven employees. Eighty-one ovens are normally pushed during each turn.

The larry cars for the batteries were built by Wilputte in 1952. In 1976, the larry car for battery no. 1 was modified to include new drop sleeves, new volumetric controls and a new drive for its central turntable. Both larry cars have three hoppers, each of which is filled with coal from a coal bunker located between the batteries.

The pusher and coke side door machines for both batteries were built in 1952 by Wilputte (each battery has one push side and one coke side door machine), as was the quench car which services both batteries. There were no significant modifications to either the push side door machine, the coke side door machine, the quench car, or the larry car for battery no. 2 between 1952 and the time of the Secretary's inspection in this case.

II

A major hazard to coke oven employees is the risk of certain types of cancer and other diseases caused by exposure to coke oven emissions. The primary hazards are briefly presented in the following quotation from the preamble to the coke oven emission standard (29 C.F.R. § 1910.1029):

> The evidence in the record conclusively supports the finding that coke oven emissions play a causal role in the induction of cancer of the lung and genito-urinary tract in the exposed population. Constituents of coke oven emissions and coal tar, a by-product of the coking process, are known animal skin carcinogens and have been related to increased skin cancer mortality in human populations similar to coke oven workers. This information is sufficient to warrant protective measures designed to reduce employee exposure to coke oven emissions.

41 Fed. Reg. 46748 (1976).

Coke oven emissions can leak out of coke ovens at any unsealed point, such as charging holes, doors, door frames, standpipes and goosenecks. Emissions also result whenever the gas-tight integrity of coke ovens is necessarily disturbed, like during the charging and pushing procedures. Emissions are released into the air as well while coke is in the quench car, prior to being cooled.

Because of the hazards inherent in coke oven operations, employee exposure to coke oven emissions has been, and is, regulated. The Secretary

promulgated the first "coke oven" standard in 1969 under the Walsh-Healey Act, 41 U.S.C. §§ 35-45. That standard adopted a 1967 recommendation of the American Conference of Governmental Industrial Hygienists and set an exposure limit of 200 micrograms of coal tar pitch volatiles per cubic meter of air (200 $ug/m^3$) for an eight-hour work day. In 1971, the standard was adopted as an "established Federal standard"[3/] under section

---

3/ The standard was published at 29 C.F.R. § 1910.93 and will subsequently be referred to as the 1971 standard. It has since been redesignated section 1910.1000:

> § 1910.1000 Air contaminants.
>
> An employee's exposure to any material listed in tables Z-1, Z-2, or Z-3 of this section shall be limited in accordance with the requirements of the following paragraphs of this section.
>
> (a) Table Z-1:
>
> * * *
>
> (2) Other materials -- 8-hour time weighted averages. An employee's exposure to any material in table Z-1, the name of which is not preceded by "C", in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average given for that material in the table [Table Z-1 assigns coal tar pitch volatiles (which material is not preceded by a "C") a time weighted average of 200 ug/m3]. [§ 1910.98 provided that the effective date of § 1910.93 was August 27, 1971.]
>
> * * *
>
> (e) To achieve compliance with paragraph (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with § 1910.134.

6(a) of the Act, 29 U.S.C. § 655(a). Section 1910.93 provided that feasible engineering and administrative controls be used to reach the standard's limits but did not specify particular controls.

Later in 1971, the American Iron and Steel Institute (AISI), of which USS is a member, petitioned the Secretary for a standard specifically directed at coke ovens. Also that year the United Steelworkers of America petitioned the Secretary for a more stringent standard directed at coke oven emissions. Although the Secretary denied both petitions, he did request the National Institute of Occupational Safety and Health (NIOSH) to expedite research relating to employee exposure to coke oven emissions. In February of 1973, NIOSH issued a report recommending the use of specific engineering controls and operating procedures, supplemented by respiratory protection programs, for coke oven plants.

In 1974, the Secretary empanelled a standards advisory committee on coke oven emissions to review the NIOSH report and make recommendations for a new coke oven emissions standard. That committee submitted a 3,500-page report to the Secretary in 1975.

The Secretary published his proposed standard for coke oven emissions in the Federal Register on July 31, 1975. From November 4, 1975 to January 8, 1976, and from May 4, to May 14, 1976, hearings were held on the proposed standard pursuant to section 6(b) of the Act, 29 U.S.C. § 655(b).

On October 22, 1976, the Secretary published the new coke oven emissions standard, to become effective on January 20, 1977, 41 Fed. Reg. at 46742-90. The standard lowered the permissible exposure level limit for coke oven emissions to 150 micrograms per cubic meter of air (150 ug/m3) averaged over an eight-hour period. 29 C.F.R. § 1910.1029(c).

To attain the new permissible exposure limit, the standard mandated an extensive list of particular engineering and work practice controls to be implemented ". . . at the earliest possible time, but not later than January 20, 1980. . . ." 29 C.F.R. § 1910.1029(f)(1)(i)(a).

III

As mentioned earlier, this case involves the issuance of five citations by the Secretary to USS in September 1977. Citations 1 and 2, both designated serious, were directed at USS's coke oven batteries 1 and 2, respectively. Each citation charged employee exposure to excessive amounts of coke oven emissions, as well as USS's failure to provide numerous controls mandated by section 1910.1029(f). Citation 3, also designated serious by the Secretary, included allegations of noncompliance with sections 1910.1029(g) (respirators), 1910.1029(h) (cleaning of protective clothing), and 1910.1029(i) (hygiene practices), and with provisions of section 1910.1029 dealing with written procedures and schedules required to be included in USS's training program. Citation 4 was alleged to be repeated and citation 5 other than serious. The latter two citations include allegations of noncompliance with certain requirements for respirators and with the requirement that hot and cold, or tepid, running water should be provided in lavatories. Before discussing the merits of the individual citation items, we must first address an overriding legal issue common to many of the items.

A

Certain of the items in citations 1 and 2 involve allegations that USS failed to implement various specific controls required by section 1910.1029(f). USS contends that it did not have time and was therefore not required to implement some of these controls in the two months

between the 1977 standard's effective date and the inspection.[4/] The Secretary does not dispute that two months was an insufficient time to install these controls but contends that USS was obligated to implement the controls under the 1971 standard and that this obligation continued under the 1977 standard. According to the Secretary, USS had sufficient time to implement the controls under the 1971 standard and may be found in violation of the 1977 standard for not doing so. The United Steelworkers of America and its Local 4889 ("the Union") have elected party status in these proceedings, and support the Secretary's reasoning on this issue.

This issue centers on the following language from section 1910.1029(f)(1)(i)(a):

> The employer shall institute the engineering and work practice controls listed in paragraphs (f)(2), (f)(3) and (f)(4) of this section in existing coke oven batteries at the earliest possible time, but not later than January 20, 1980, except to the extent that the employer can establish that such controls are not feasible. In determining the earliest possible time for institution of engineering and work practice controls, the requirement, effective August 27, 1971, to implement feasible administrative or engineering controls to reduce exposures to coal tar pitch volatiles,[5/] shall be considered. . . . (Emphasis added).

---

4/ The citation items to which this issue pertains are: Citation 1, item 2, and Citation 2, item 2 (absence of stage charging); Citation 1, item 3, and Citation 2, item 3 (steam aspiration system did not provide sufficient negative pressure and flow volume); Citation 1, item 4, and Citation 2, item 5 (absence of mechanized gooseneck and standpipe cleaners); Citation 1, item 5, and Citation 2, item 6 (inadequate spare push side and coke side doors); Citation 1, item 12, and Citation 2, item 14 (positive pressure, temperature controlled filtered air not provided for cabs of equipment); Citation 1, item 13, and Citation 2, item 15 (stand-by pulpits equipped with positive pressure, temperature controlled air not provided); and Citation 2, item 4 (larry car not equipped with individually operated drop sleeves and slide gates).

5/ Coal tar pitch volatiles as used in the 1971 standard are identical to the benzene soluble fraction of total particulate matter used in 1910.1029 as the standard of measurement for the permissible exposure limit. 41 Fed. Reg. at 46752, col. 3.

USS's primary argument is that, at the time of the inspection, it had not yet been obligated to implement the engineering and work practice controls required by the 1977 standard because the short two-month period between the effective date of that standard and the inspection did not allow it enough time to do so. USS argues that the 1977 standard gave it until January 20, 1980 to install the mandated controls.

USS argues that absent evidence its employees were exposed to CTPV emissions in excess of the 200 $ug/m^3$ limit in the 1971 standard, it was not obligated to adopt and implement any controls or work practices prior to January 20, 1977.[6/] This being so, the Secretary's citation items alleging USS's failure to implement controls like stage charging, modified larry cars, improved steam aspiration systems, mechanized standpipe and gooseneck cleaners, adequate door supplies, and filtered air for cabs and pulpits are improper because the Secretary has never contended that those items could have been implemented in the period between the publication of the 1977 standard and the inspection.

USS also contends that its failure to install the specific controls mandated by the 1977 standard cannot be considered a violation of the 1971 standard's requirement to install feasible engineering and administrative controls. If such controls had been required by the 1971 standard then, according to USS, there would have been no need to have them spelled out in detail by the 1977 standard.

The Secretary argues that USS failed to implement the engineering and work practice controls required by section 1910.1029 at the earliest

---

6/ USS contends that the only evidence of record concerning the emissions to which its employees were exposed is contained in a stipulation that, at the time of the inspection, employees were exposed to concentrations in excess of 150 $ug/m^3$.

possible time. He states that USS has been legally obligated to adopt all feasible engineering controls to reduce coke oven emissions since the effective date of the 1971 standard, and that if USS had begun to implement the controls mandated by the 1977 standard when those controls first became feasible, the controls would have been in place by the time of the inspection. The Secretary maintains that "the obligation to implement all generally feasible engineering or administrative controls under the 'old' standard is the legal equivalent of the responsibility to implement the specifically mandated controls and work practices under the 'new' standard." In support of this position, the Secretary points to that section of the 1977 standard's preamble that refers to the obligations of employers under the 1971 standard and sets out the view that recalcitrant employers not get the benefit of an extended time frame for institution of controls under the 1971 standard.[7/]

---

7/ The relevant portion of the preamble states:

> Finally, a difficult compliance issue presented by the promulgation of the new standard involves its relationship, within the context of enforcement, to the employer's legal obligations under the prior standard (29 C.F.R. § 1910.1000, 1002). The present standard, at paragraph (f)(1)(i) requires the implementation of specific engineering controls and work practices at the earliest possible time but not later than January 20, 1980. To this end, employers are presently required to develop written programs and to implement specific controls. However, the agency recognizes that employers had a legal obligation under the prior standard to reduce coke oven emission exposures by means of feasible engineering and administrative controls. It is not the intention of the agency, through the promulgation of this standard, to vitiate the legal requirements under

(continued on next page)

B

Judge Brennan agreed with the Secretary's interpretation of section 1910.1029(f)(1)(i)(a). He held that, in determining whether an employer had installed the controls required by the 1977 standard in the "earliest possible time," it was appropriate to consider whether an employer had the obligation to install such controls under the 1971 standard, prior to the 1977 standard going into effect. The judge further concluded that USS had had an obligation to install controls under the 1971 standard. Although the judge conceded the record does not establish that USS failed to comply with the exposure limit in the 1971 standard, he stated that USS's argument essentially asked him to rule that the Fairless coke ovens were in compliance with the 1971 standard. But that claim, the judge concluded, was not supported by the record either. The judge construed USS's argument as an affirmative defense and placed upon USS the burden of proving compliance with the 1971 standard in order

---

7/ (continued)

> the old standard. Rather, OSHA views the two standards as representing continuum of enforceable obligations which have been crystallized in the standard's promulgation.
>
> More specifically, in evaluating whether the employer has instituted controls at the earliest possible time, OSHA compliance personnel would consider not only the employer's performance under the new standard but also his prior obligations under its predecessor. It is OSHA's view that recalcitrant employers who have implemented only a few or no controls or work practices under the prior CTPV standard should not benefit from a newly extended time frame established under the new standard. Rather, cognizant of their prior legal obligations, such employers would be subject to citation under the new standard for failure to implement controls at the earliest possible time.

41 Fed. Reg. 46773 (October 22, 1976)

to establish the defense. He ruled that USS had not carried that burden, and that in fact the record best supports the contrary conclusion. The judge stated that it "strains credulity" to conclude that the Fairless batteries had no coke oven emissions on January 19, 1977, while just sixty days later, at the time of inspection, the batteries were producing extensive coke oven emissions. The judge also stated USS had not shown that any of the "feasible engineering or administrative controls" required by the 1971 standard had been implemented prior to the promulgation of the 1977 standard, whereas well-known engineering controls like stage charging and quickly implementable work practices like proper inspections and repairs had not been implemented at the time of the inspection.

On review, the parties adhere to the interpretations of the standard they advanced before the judge. In addition, USS takes particular exception to the judge's conclusion that it had been under an obligation to install controls under the 1971 standard. USS reiterates its argument that there is no evidence it ever violated the 1971 standard, and contends that the judge improperly shifted the burden to USS to prove that it had been in compliance with the 1971 standard. The Secretary, on the other hand, contends that the judge properly regarded this claim as an affirmative defense. The Secretary contends that it would be nearly impossible for him to now show that USS exceeded the CTPV exposure limits under the 1971 standard, whereas USS could more easily show it had complied with the 1971 standard — if USS had indeed been in compliance with that standard. Moreover, the Secretary reiterates, the 1977 standard presumes that all coke oven employers had failed to comply

with the 1971 standard, citing the preamble to the 1977 standard at 41 Fed. Reg. 46756, col.1:

> Although the industry generally has failed to utilize emissions control technology which has been available for some time . . . and have exceeded the existing permissible exposure limit of [200 ug/m3] (Exh. 68), exposure levels below 150 ug/m3 have been reached at various times on various batteries for various job classifications. . . .

The Secretary then points out that USS's Fairfield, Alabama, plant had implemented many of the controls mandated by the 1977 standard and that "[i]t begs credulity to argue that Respondent's Fairless, Pennsylvania Works, which had implemented virtually none of these controls and work practices, was in compliance with the 200 microgram limit of the old standard particularly in light of the fact that Respondent's engineers had concluded in 1974 that the Fairless batteries had to be rebuilt, as well as the dilapidated condition of the batteries in March 1977." A similar argument is advanced by the Union.

The Union also agrees with the judge's conclusion. It states that the coke oven emissions standard itself and the preamble to that standard create a presumption of noncompliance with the 1971 standard by USS and the other members of the coking industry, citing 41 Fed. Reg. at 46760. In support of this position, the Union advances the following reasons:

> 1) The evidence relied upon by the Secretary in setting the standard indicates that employee exposures were uniformly in excess of the 1971 standard. This was true even after the implementation of stage charging at USS's model plant in Fairfield, Alabama;
>
> 2) If the Fairless plant was in compliance with the 1971 standard, knowledge of such compliance is uniquely with USS;
>
> 3) USS introduced evidence showing that its employees were exposed to excessive amounts of CTPV under

> the 1971 standard when its own witnesses testified that respirators had been required at Fairless since 1971. USS would not have issued respirators if it had been in compliance with that standard.

The Union also suggests that, rather than vacating for lack of evidence on the issue, the Commission should remand the case for the limited purpose of taking evidence on compliance with the 1971 standard if the Commission finds that further evidence on the issue is required.

C

Prior to the effective date of the 1977 standard, employers whose employees were exposed to coke oven emissions in excess of 200 $ug/m^3$ were required by the 1971 standard to implement feasible engineering and administrative controls to reduce that exposure. The 1977 standard reduced the exposure limit to 150 $ug/m^3$, specified various engineering and work practice controls for achieving this exposure level, and imposed additional obligations that did not exist under the 1971 standard, such as requirements for medical surveillance of employees. Thus, the purpose of the 1977 standard was to strengthen the protection afforded to employees exposed to coke oven emissions. In providing that employers had to install specific controls "at the earliest possible time, but not later than January 20, 1980," the Secretary did not intend to "wipe the slate clean" for employers who were not then in compliance with the 1971 standard. He made this explicit by also providing that, "[i]n determining the earliest possible time for institution of engineering and work practice controls, the requirement, effective August 27, 1971, to implement feasible administrative or engineering controls to reduce exposures to coal tar pitch volatiles, shall be considered." 29 C.F.R. § 1910.1029(f)(1)(i)(a).

The 1971 standard mandated those controls which are feasible but only where controls were necessary to "achieve compliance" with the exposure limit specified in that standard. In this case, USS was required to implement controls between 1971 and 1977 only if, and when, USS's employees were exposed to CTPV in excess of the eight-hour time-weighted average of 200 $ug/m^3$. It was employee overexposure that triggered the need to implement controls under the 1971 standard. Judge Brennan found, and the Secretary does not dispute the finding, that the record does not establish USS's employees were exposed to CTPV emissions in excess of the 200 $ug/m^3$ limit of the 1971 standard. We agree with this finding of the judge, and reject the argument of the Secretary and the Union that the judge properly characterized as an affirmative defense USS's argument that it was not obligated to implement controls before the effective date of the 1977 standard. The burden of proof rests with the Secretary to prove all essential elements of a violation. See National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973). In this case, the Secretary must prove that USS failed to implement controls by the earliest possible time. In order to meet this burden, the Secretary would have to show either that USS had sufficient time to install the controls after the effective date of the 1977 standard, a burden the Secretary does not contend he has met, or he would have to show that USS had an obligation to install the controls before the 1977 standard went into effect. To show the latter, the Secretary would have to prove that USS's employees had been exposed to CTPV in excess of the 200 $ug/m^3$ limit of the 1971 standard. Such proof is an essential element of the Secretary's case, not an affirmative defense.

The only evidence concerning the levels of coke oven emissions to which USS's employees were exposed at any time is a stipulation of the parties that, at the time of the inspection, the concentrations exceeded 150 $ug/m^3$ on an 8-hour time weighted average basis. The evident purpose of this stipulation was to establish excessive exposures under the 1977 standard. But such a stipulation cannot give rise to an inference that exposures exceeded 200 $ug/m^3$ either during the inspection or at any time prior thereto. The Secretary contends that evidence of exposures prior to the inspection is peculiarly within the knowledge of USS and that the burden of proof should therefore be on USS. However, that an employer may have superior knowledge of certain facts does not relieve the Secretary from meeting his burden of proof. If USS has information concerning the levels of CTPV to which its employees were exposed prior to 1977, the Secretary could have sought to obtain this information through discovery. See Commission Rules 52 and 53, 29 C.F.R. §§ 2200.52 and 53. Additionally, levels of exposures at the time of the inspection, coupled with evidence that conditions and practices in USS's coke ovens had remained substantially unchanged over a certain period of time, could give rise to an inference that the levels of exposures existing at the inspection had also existed prior to the inspection. However, the Secretary did not attempt to prove that the exposures during the inspection exceeded 200 $ug/m^3$. We cannot infer that the levels prior to the inspection exceeded those at the inspection.

We also reject the Secretary's argument that the 1977 standard creates a presumption that all coke oven employers had failed to comply with the 1971 standard, in support of which the Secretary has cited that portion of the 1977 standard's preamble which reads, "[a]lthough the

industry generally (emphasis added) has failed to utilize emissions control technology . . . and have (sic) exceeded the existing permissible exposure limit of [200 ug/m$^3$,] . . . exposure levels below 150 ug/m$^3$ have been reached . . ." 41 Fed. Reg. 46756 (1976). The Secretary's burden of proof must be discharged in the course of a formal proceeding before the Commission, and the Commission's decision must be made on the record produced in that proceeding. See National Realty, supra. The Secretary's evidence must be introduced under circumstances that allow USS the opportunity to cross-examine the Secretary's witnesses and put on its own case. Instead, however, the Secretary and the Union would short circuit this process by substituting as proof statements made by the Secretary in the 1977 standard's preamble which do not specifically address themselves to USS's Fairless Works and which were not tested by the cross-examination of USS's attorneys. That is improper. Further, the statements in the preamble are not written in such definite terms as to make us think that the Secretary ever intended to create an industry-wide presumption of noncompliance with the 1971 standard — even if he thought he had the power to do so.

We also reject the Union's argument that USS's issuance of respirators to the coke oven workers at Fairless prior to the 1977 standard should be taken as proof that USS was not in compliance with the exposure limits of the 1971 standard. Several courts have held that an employer's own safety precautions, absent other evidence, do not establish that the employer believed that such precautions were necessary in order to comply with a particular standard. S & H Riggers & Erectors, Inc. v. OSHRC, 659 F.2d 1273, 1284 (5th Cir. 1981); Diebold, Inc. v. Marshall,

585 F.2d 1327, 1338 (6th Cir. 1978); Cape and Vineyard Division v. OSHRC, 512 F.2d 1148, 1154 (1st Cir. 1975). We agree.

Finally, we reject the Union's suggestion that we should remand for further evidence on whether USS was in compliance with the 1971 standard. The Secretary and the Union either were or should have been aware at the time of the hearing that it was necessary to prove that USS had violated the 1971 standard in order to sustain the allegation that USS had not implemented engineering and work practice controls at the earliest possible time. There is no contention that there has been any newly discovered evidence, nor does the case involve any change in the controlling law since the time of the hearing to justify reopening the record for additional evidence. See Seattle Crescent Container Service, 79 OSAHRC 91/A2, 7 BNA OSHC 1895, 1979 CCH OSHD ¶ 24,002 (No. 15242, 1979). Cf. Samson Paper Bag Co., 80 OSAHRC 60/A2, 8 BNA OSHC 1515, 1980 CCH OSHD ¶ 24,555 (No. 76-222, 1980) (remand to reopen the record when controlling precedent had changed since the hearing). Under the circumstances, the necessity of bringing an end to litigation is pre-eminent. Seattle Crescent Container Service, supra.

Accordingly, we vacate items 2, 3, 4, 5, 12 and 13 of citation 1 and items 2, 3, 4, 5, 6, 14 and 15 of citation 2.[8/]

IV

In addressing the remaining items in citations 1 and 2, we first consider the argument raised by USS that the Secretary may not issue separate citations of the same alleged violations for batteries 1 and

---

8/ See note 4 supra.

2. As indicated earlier, in citation 1 the Secretary cited alleged instances of noncompliance with standards at battery 1. In citation 2, the Secretary, for the most part, cited USS for noncompliance with the same standards involved in citation 1, but for instances of noncompliance alleged to have occurred at battery 2. USS contends that this procedure improperly subjected it to being penalized twice for noncompliance with a single standard.

The judge found that the Secretary's action in issuing separate citations for batteries 1 and 2 was a proper exercise of administrative discretion. Judge Brennan observed that section 1910.1029(b) defines a coke oven battery as a "structure containing a number of slot-type coke ovens" and that USS had two such structures at Fairless — which it had designated as batteries 1 and 2. He also found that the coke oven industry generally considers each battery a distinct entity and noted that section 1910.1029(f)(3)(i)(a) uses the words "each battery." More importantly, observed the judge, each battery is a potential source of emissions and each battery must therefore be equipped with the controls required by the standard. The judge also added that the Secretary could justifiably have cited each oven separately.

USS argues that the judge erred by refusing to combine citations 1 and 2 on the ground that those citations duplicate one another. It points out that the two batteries are but two parts of a single physical structure and that compliance officer Stranahan testified, "They are like two rectangular boxes placed end to end with a coal bunker separating them. . . . Physically, they are connected. . . ." USS contends that the batteries do not individually meet the definition of a coke oven battery in section 1910.1029(b): a "structure containing a number

of slot-type ovens. . ." The fact that it has itself designated the batteries as 1 and 2 should not be dispositive, USS asserts, because the Commission should not be "overly impressed by nomenclature." To support its argument that the judge erroneously failed to combine citations 1 and 2, USS points to the stipulation of the parties that the involved "batteries" are both Wilputte combination, double-divided underjet batteries with 87 ovens per battery; that all the ovens are the same size, take the same amount of coal, have the same coal line, and have the same coking temperatures and coking time; that both batteries have double collector mains, three charging holes, larry cars and door machines.

The Secretary argues that differentiation of the violations on a battery by battery basis is within his administrative discretion. Choosing to cite batteries 1 and 2 separately in this case helps assure meaningful penalties designed to effect employer compliance with the standards, the Secretary contends. He also contends that section 1910.1029(f)(1) contemplates the battery as an appropriate unit to which the standard's requirements apply because it states that employers shall institute the engineering and work practice controls "in existing coke oven batteries."

The Secretary also argues that the structure of USS's coking operations demonstrates the appropriateness of his separate citations. He finds it "significant" that USS designated the batteries as 1 and 2, and even more significant that USS uses two sets of machinery for the two parts of its coking operations. USS was, therefore, able to shut down and rehabilitate battery 1 while continuing to operate battery 2 in April of 1977.

To the extent that the judge's action on this issue permits the assessment of more than one penalty against USS for the same conduct, the judge's action is reversed by the Commission. In resolving this issue, Chairman Rowland points out that it is necessary to understand the structure of 29 C.F.R. § 1910.1029(f). Section 1910.1029(f) is entitled "Means of compliance." Subsection (f)(1) is entitled "Priority of compliance methods," and is itself divided into three subsections: (f)(1)(i) is entitled "Existing coke oven batteries"; (f)(1)(ii) is entitled "New or rehabilitated coke oven batteries"; and (f)(1)(iii) is entitled "Beehive ovens." Because USS's batteries existed when the standard took effect, subsection (f)(1)(i) is relevant in this case. It provides that the employer "shall institute the engineering and work practice controls listed in paragraphs (f)(2), (f)(3), and (f)(4) of this section in existing coke oven batteries. . . ." Paragraphs (f)(2), (f)(3), and (f)(4) contain a number of specific steps the employer must take to reduce its employees' exposure to coke oven emissions.

The focus of section 1910.1029(f) is thus the controls employers must institute, not the number of batteries in a particular facility. Indeed, the reference to "existing coke oven batteries" in subsection 1910.1029(f)(1)(i) is only to contrast that subsection with those governing new or rehabilitated batteries and beehive ovens, not to indicate a regulatory intent that each separate "battery" within a facility can be the subject of a separate citation involving the same alleged conduct.

Chairman Rowland further notes that the Secretary's position in this case is inconsistent with his own administrative guidelines. The

Secretary contends that he has discretion to issue separate citations for each battery, each employee, or each job classification, and chose the former as a "reasonable" middle ground. However, the Secretary has issued internal guidelines that limit his authority to issue multiple citations and proposed penalties to an employer for a violation of a single standard. Chapter X, sec. C.1(a) of the Secretary's Field Operations Manual provides that "[a]ll violations of a single standard found during the inspection of a single establishment or worksite should be combined into one alleged violation." Similarly, in discussing citations for violations of the air contaminant standard at 29 C.F.R. § 1910.1000, the Secretary's Industrial Hygiene Field Operations Manual states that "[w]hen more than one employee is exposed to the same hazard, the operation would be listed as separate instances for the same item." Chapter I, sec. H.2(b). With regard to citations under the coke oven standard, at the time the violations in this case occurred there was in effect a program directive providing that separate citations should be issued for violations of certain sections for each battery inspected, but that only one citation per plant should be issued for violations of other sections. OHSA Program Directive # 300-10 (Sept. 6, 1977), reprinted in BNA Occ. Saf. & Hlth Rptr Ref. File, p. 21:9107. In arguing that he has unlimited discretion to issue separate citations for each battery, employee, or job classification, the Secretary is ignoring his own guidelines.

Chairman Rowland also believes that the Secretary's Field Operations Manual and Industrial Hygiene Field Operations Manual represent an acknowledgement that it is fundamentally unfair to assess multiple

penalties against an employer for the same conduct. Thus, to the extent that the separate citations for batteries 1 and 2 were issued in conformity with Program Directive # 300-10, Chairman Rowland does not agree that the directive is appropriate. He notes that the Secretary's internal instructions and guidelines are not binding on the Commission. George C. Christopher & Sons, Inc., 82 OSAHRC _____, 10 BNA OSHC 1436, 1445, 1982 CCH OSHD ¶ 25,956 at p. 32,533 (No. 76-647, 1982).

Chairman Rowland would, therefore, in those instances where the Commission finds that USS violated particular subsections of section 1910.1029(f) by failing to implement certain controls in both batteries, combine the items as part of a single citation and assess a single penalty. See Safeway Stores, Inc., 74 OSAHRC 92/D1, 2 BNA OSHC 1439, 1974-75 CCH OSHD ¶ 19,161 (No. 454, 1947), vacated upon reconsideration on other grounds, 75 OSAHRC 54/C2, 3 BNA OSHC 1123, 1974-75 CCH OSHD ¶ 19,694 (No. 454, 1975).

Commissioner Cleary finds it unnecessary to consider whether the Secretary's action in issuing separate citations for batteries 1 and 2 was a proper exercise of administrative discretion. Ultimate authority for assessment of penalties lies with the Commission, 29 U.S.C. § 666(j), and the Commission may, when it deems it appropriate, assess a single penalty for two or more violations. See H. H. Hall Construction Co., 81 OSAHRC 91/D12, 10 BNA OSHC 1042, 1981 CCH OSHD ¶ 25,711 (No. 76-4765, 1981); Hoffman Construction Co., 78 OSAHRC 2/A2, 6 BNA OSHC 1274, 1978 CCH OSHD ¶ 22,489 (No. 4182, 1978). Commissioner Cleary would find it sufficient to assess single penalties in the amounts specified below, for those items which involve identical violations on the two batteries.

V

We will now address the merits of those items in citations 1 and 2 that we have not already vacated on the basis that USS did not have sufficient time to implement particular controls. We will then address the balance of the contested citation items in the case.

Citation 1, Item 1 and Citation 2, Item 1

These items of serious citations 1 and 2 allege noncompliance with the standard at section 1910.1029(c)[9/] in that the following classifications of employees were exposed to coke oven emissions in batteries 1 and 2 at concentrations greater than 150 micrograms per cubic meter of air for an average eight-hour period: (1) the larry car operator,

---

9/ The standard at section 1910.1029(c) provides:

§ 1910.1029 Coke oven emissions.

* * *

(c) Permissible exposure limit. The employer shall assure that no employee in the regulated area is exposed to coke oven emissions at concentrations greater than 150 micrograms per cubic meter of air (150 ug/m3), averaged over any 8-hour period.

(2) lidmen, (3) the coke side jamb cleaner, (4) the coke side door machine operator, and (5) the push side door machine operator (citation 1 only). A $1000 penalty was proposed for each item.

The parties stipulated that the employees in the cited job classifications "were exposed to coke oven emissions, without regard to the use of respirators, at concentrations greater than . . . 150 $ug/m^3$ . . . averaged over 8-hour periods. . . ." The judge found that USS violated the standard based on this stipulation and assessed the proposed $1000 penalties for each of these items.

USS contests the judge's action for two reasons: 1) the employees in the cited job classifications were all wearing respirators that brought the level of contaminants actually breathed by the employees to a level below the permissible exposure limit. Thus, there was no violation, USS argues, citing Administrative Law Judge Chaplin's decision in FMC Corp., 74 OSAHRC 80/E2, 2 BNA OSHC 3216, 1974-75 CCH OSHD ¶ 18,735 (No. 4871, 1974), and 2) since the Third Circuit found in American Iron and Steel Institute v. OSHA, 577 F.2d 825 (3d Cir. 1978), cert. dismissed, 448 U.S. 917 (1980), that no coke oven battery in the country had ever consistently reduced contaminants to the permissible exposure level, and since USS had until January 20, 1980 under the 1977 standard to implement all the controls required by that standard, USS should not be cited in 1977 for exceeding the permissible exposure limit.

The Secretary contends that the stipulation referred to above established a prima facie violation of section 1910.1029(c), particularly since section 1910.1029(f)(1)(i)(a) states respirators may be used as supplemental protection only. Even though section 1910.1029(g), entitled

"Respiratory Protection," contains an exception that does allow respiratory protection to be used during the time period necessary to install controls, the Secretary argues that USS cannot avail itself of this exception because USS had ample time to install controls before the inspection. The Secretary also points out that in an analogous situation the Commission has rejected a contention that an employer failed to violate the noise exposure standard at section 1910.95 because its employees were wearing ear protective equipment and therefore not actually subjected to noise in excess of the required limits, citing Turner Co., 76 OSAHRC 108/A2, 4 BNA OSHC 1554, 1564, 1976-77 CCH OSHD ¶ 21,023 (No. 3635, 1976), remanded on other grounds, 561 F.2d 82 (7th Cir. 1977). Further, the Secretary argues, some 25-50 per cent of USS's employees did not regularly wear respirators; included in this number were one of the larry car operators in battery 1 who did not wear his respirator although engulfed by visible emissions and one of the coke side door machine operators in battery 2, who was seen walking through visible emissions without a respirator.

We vacate these items. The cited standard states USS's general duty to protect its employees from excessive coke oven emissions exposure levels. To the extent that this duty can be discharged by implementation of specific engineering and work practice controls, item 1 in citations 1 and 2 is duplicative of the items discussed below which pertain to the specific engineering and work practice controls mandated by sections (f)(2) and (f)(3) of section 1910.1029.

However, section 1910.1029(g)(1)(i)(a) requires that respirators be used during the time period necessary to install or implement feasible

engineering or work practice controls. Section 1910.1029(g)(1)(ii), though, effectively stays, in part, the operation of section 1910.1029 (g)(1)(i)(a) by the following terms:

> Notwithstanding any other requirement of this section, until January 20, 1978, the wearing of respirators shall be at the discretion of each employee where the employee is not in the vicinity of visible emissions.

Therefore, with respect to the cited instances of alleged noncompliance that involve employees overexposed to coke oven emissions, but not exposed to visible emissions, we vacate because section 1910.1029 (g)(1)(ii) makes respirators use in such circumstances voluntary only. With respect to instances of alleged noncompliance that involve employees working in visible emissions, we note that the Secretary has made that same allegation in item 1c of citation 3,[10/] where noncompliance with section 1910.1029(g)(2)(i) is alleged. Because the latter standard is more specifically applicable to employees working without respirators in visible emissions, we vacate this remaining portion of the section 1910.1029(c) allegation and address the merits of the visible emissions charge under the section 1910.1029(g)(2)(i) allegation of item 1c in citation 3.

---

10/ Item 1c of citation 3, discussed *infra*, alleges that USS did not select and assure use of appropriate respirators by employees at certain enumerated work stations where they were in the vicinity of visible emissions. Citation 3, item 1c includes some but not all of the work stations alleged in item 1 of citations 1 and 2. Those work stations appearing in the latter items but not in citation 3, item 1c accordingly represent employees whom the Secretary does not allege to have been in the vicinity of visible emissions.

Citation 1, Items 6, 7, 9 and Citation 2, Items 7, 8, 10

The Secretary alleges in citation 1, item 6 and citation 2, item 7 that USS failed to comply with section 1910.1029(f)(2)(ii)(d)[11/] in that batteries 1 and 2 were not equipped with chuck door gaskets to control door emissions until the chuck doors could be repaired.

The judge found noncompliance with the cited standard and assessed $1000 penalties for each item. The judge pointed out that the parties stipulated there were leaking chuck doors at each battery and that USS was not using chuck door gaskets at the time of inspection. The judge rejected an argument made by USS that it was not using gaskets because it was experimenting with sealing the chuck doors by "luting" them, i.e., applying a tar-like material to joints at which leakage could occur. He stated that luting is not at all experimental, and that it is instead a very old method of plugging leaks.

---

11/ The standard at section 1910.1029(f)(2)(ii)(d) reads:

§ 1910.1029 Coke oven emissions.

* * *

(f) Methods of compliance.

* * *

(2) Engineering controls.

* * *

(ii) Coking. The employer shall equip and operate existing coke oven batteries with all of the following engineering controls to control coke oven emissions during coking operations;

* * *

(d) Chuck door gaskets to control chuck door emissions until such door is repaired, or replaced. . . .

The Secretary alleges in citation 1, item 7 and citation 2, item 8 that USS failed to comply with section 1910.1029(f)(3)(i)(a)(2)[12/] at batteries 1 and 2 in that, prior to each charge, push side and coke side goosenecks and standpipes were not inspected and cleaned to a specified minimum diameter sufficient to effectively remove evolved gases from the ovens to the collector mains and thereby help control emissions during charging operations. A $1000 penalty was proposed for each item.

The judge affirmed both items and assessed a $1000 penalty for each item. He found that USS's work schedule for the inspection and cleaning of standpipes and goosenecks, if carried out, only provided for the inspection and cleaning of each of the 348 goosenecks and standpipes on the 174 ovens at both batteries once per week. Each oven, however, has

12/ The standard at section 1910.1029(f)(3)(i)(a)(2) provides:

§ 1910.1029 Coke oven emissions.

* * *

(f) Methods of compliance.

* * *

(3) Work practice controls. (i) Charging. The employer shall operate existing coke oven batteries with all of the following work practices to control coke oven emissions during the charging operation:

(a) Establishment and implementation of a detailed, written inspection and cleaning procedure for each battery consisting of at least the following elements:

* * *

(2) Inspection and cleaning of goosenecks and standpipes prior to each charge to a specific minimum diameter sufficient to effectively move the evolved gases from the oven to the collector mains.

about ten coking cycles per week. USS's program therefore did not comply with the cited standard, which requires inspection of each standpipe and gooseneck prior to each of the ten charges and requires their cleaning whenever it becomes necessary to maintain unobstructed passages for the evolved gases.

The Secretary alleges in citation 1, item 9 and citation 2, item 10 that USS failed to comply with section 1910.1029(f)(3)(iii)(a)[13/] at the push side of coke oven batteries 1 and 2 in that the work practice of shoveling spilled coke into heated ovens was not discontinued to help control coke oven emissions. A $1,000 penalty was proposed for each item.

The judge affirmed both items, assessing $1000 penalties for each. He found that when pusher rams were retracted from the ovens after pushing coke, some of the coke spilled as a result of being brought out with the ram. He also found that certain employees were observed shovel-

(f) Methods of compliance.

* * *

(3) Work practice controls.

* * *

(iii) Pushing. The employer shall operate existing coke oven batteries with the following work practices to control coke oven emissions during pushing operations:

(a) Coke and coal spillage quenched as soon as practicable and not shoveled into a heated oven. . . .

ing spilled coke back into the ovens, and that USS's instructions to its employees consistently changed. Sometimes those instructions prohibited the proscribed practice; sometimes they sanctioned it.

The Commission affirms all of these items. Chairman Rowland affirms the judge's disposition without reaching the merits of the items. He notes that USS did not brief the items even though it had petitioned for review of them and the items had been included in the direction for review. Chairman Rowland concludes therefore that USS has abandoned any interest in review of the items. Commissioner Cleary affirms the items for the reasons given by the judge. The Commissioners assess a total penalty of $1,800 for these three sets of items, i.e., $600 is assessed for citation 1, item 6 and citation 2, item 7; $600 is assessed for citation 1, item 7 and citation 2, item 8; and $600 is assessed for citation 1, item 9 and citation 2, item 10.

Citation 1, Item 8 and Citation 2, Item 9

The Secretary alleges USS's failure to comply with section 1910.1029 (f)(3)(ii)(d)[14/] at batteries 1 and 2 in that the batteries were not

---

14/ The standard at section 1910.1029(f)(3)(ii)(d) reads:

* * *

(3) Work practice controls.

* * *

(continued on next page)

operated pursuant to an inspection system and corrective action program designed to achieve maximum control of the emissions from the push side (batteries 1 and 2) and coke side (battery 1 only) oven doors during coking. A $1000 penalty was proposed for each item.

The judge affirmed each item, assessing $1000 penalties. The judge found that over 50 per cent of all the oven doors on both batteries had been leaking emissions for at least a year prior to inspection. He also found that USS employed only two patchers (each with a helper) working on one shift five days a week to patch defective doors; door leakage was so extensive, however, that the patchers could not keep up with the deteriorated conditions. The judge therefore concluded that although USS did have a functioning door inspection and repair program, the program was not adequate to cope with the badly deteriorated condition of the door frames in both batteries.

USS argues that the judge uses the same evidence in finding noncompliance with this standard as he does in finding noncompliance with

14/ (continued)

> (ii) Coking. The employer shall operate existing coke oven batteries pursuant to a detailed written procedure established and implemented for the control of coke oven emissions during coking, consisting of at least the following elements.
>
> * * *
>
> (d) An inspection system and corrective action program to control door emissions to the maximum extent possible.

section 1910.1029(f)(2)(ii)(c)[15/] regarding insufficient spare doors, and that one of these two sets of items should be vacated as being duplicative.

USS concedes that "there was a significant problem with doors," but the problem was "caused not by the conditions of the doors themselves but rather by the condition of the structure of the battery itself, which was coming to pieces.. The actual brickwork of the battery was crumbling in various places. This deterioration of the battery caused the door jambs (or door sills) to become warped. Warpage in the door sills, of course, was the direct cause of emissions and an indirect cause as well because damage to the door sills resulted in further damage to the doors, thus giving rise to even more emissions."

---

15/ Noncompliance with section 1910.1029(f)(2)(ii)(c) was alleged in citation 1, item 5 and citation 2, item 6. The latter two citation items were vacated earlier in this decision on the basis that USS did not fail to comply with the "earliest possible time" requirement of § 1910.1029(f). Section 1910.1029(f)(2)(ii)(c) provides:

> § 1910.1029 Coke oven emissions.
>
> * * *
>
> (f) Methods of compliance.
>
> * * *
>
> (2) Engineering controls.
>
> * * *
>
> (ii) Coking.
>
> * * *
>
> (c) An adequate number of spare doors available for replacement purposes;

USS asserts that the only solution to this problem was to rebuild the battery, replace the brickwork, and thus create a sound foundation for the door sills. USS contends that the battery was rehabilitated in 1977 after the Secretary's inspection, and that plans had been made to shut down the battery for rehabilitation as early as the fall of 1976. A lack of bricks, however, resulted in those plans being postponed for three months to the first quarter of 1977. When that time elapsed, USS had to order a further postponement of three months because of problems caused by the severity of the winter.

USS argues that its door emissions control program required: (1) the cleaning of all doors before the start of each coking cycle, (2) the adjustment of doors if door emissions were not the result of unclean doors, (3) the replacement of doors and, (4) the replacement of door jamb castings and their underlying brick work.

USS also points out that it even took steps beyond those called for by its program to reduce door emissions: (1) since 1975, an employee had been on special assignment to deal with emission control programs, (2) both an outside contractor and USS's own employees had attempted to eliminate the carbon problem existing between oven walls and door frames and which caused the door frames to bow, (3) a contractor had been hired to clean the doors with high pressure hoses, and (4) USS was working to develop a more effective door.

The Secretary supports the judge's reasoning. He argues that noncompliance with the cited standard is established by the fact that USS was attempting to do patch work on the 41 leaking doors observed during the inspection with just six employees working on only one shift for five days a week.

Commissioner Cleary would affirm these items and assess a total penalty of $1000. He finds that USS knew the doors were a "significant problem" yet only assigned six employees working five days a week on the 8 a.m. to 4 p.m. shift to work on them while the ovens remained in operation seven days a week, 24 hours a day. Commissioner Cleary concludes that this was not a corrective action program designed to "control door emissions to the maximum extent possible," in spite of the other elements of USS's door repair program. He finds that the Secretary proved noncompliance with the cited standard by establishing the great extent of the door problems and the insufficiency of the number of employees assigned to service those problems.

USS's allegation that the instant items are duplicative of item 5 in citation 1 and item 6 in citation 2 is rejected by Commissioner Cleary. He finds that the latter items (item 5 in citation 1 and item 6 in citation 2) deal only with the number of doors available while the instant items (item 8 in citation 1 and item 9 in citation 2) concern the requirement for an "inspection system and corrective action program." Further, as noted above, item 5 in citation 1 and item 6 in citation 2 have been vacated in this decision.

Chairman Rowland would vacate this item because he finds the record does not show USS failed to take sufficient steps to control door emissions. He also finds that the record does not show that the doors were not rebuilt to the maximum extent possible. A comparison of exhibit C-18, which lists the number of doors having problems in 1974, with the number of doors stipulated as leaking at the time of the inspection (40 out of the total of 348 doors), demonstrates that the percentage of leaking doors had actually diminished. The judge's finding that 50

per cent of the doors had been leaking does not find support in the record. Although employees Offenheiser and Siminitus testified that 50 per cent of the doors needed replacement, it does not follow as the judge found that 50 per cent of the doors were leaking. Offenheiser based his estimate that 50 per cent of the doors required replacement on two factors: (1) his observation of emissions coming from the doors and (2) USS's replacement of all the doors when the battery was rebuilt. Neither factor supports Offenheiser's conclusion, however. During the door rebuild, the size of the door plugs and depth of the smoke channels was changed in an effort to produce a door with a more effective seal. It was, therefore, only this attempt at reducing future emissions that necessitated the rebuilding of all the doors. Further, Chairman Rowland would consider it unfair to penalize USS for its decision to rebuild the entire battery. Also, the fact that Offenheiser observed emissions coming from the doors does not establish that any particular door needed replacement. Clearly, a door may leak from causes other than defects in the door itself, such as the presence of deposits which merely need to be cleaned.

It should also be noted that the credibility of both Offenheiser and Siminitus had been downgraded by the judge, who stated that he did not place exclusive reliance on their testimony. Offenheiser had testified that there was no program to adjust the doors, that millwrights were not present to repair and replace doors, that patching was not performed, and that at the time of the inspection USS had no program for adjusting doors. Offenheiser's testimony about the doors not being adjusted at inspection time even conflicts with that of fellow em-

ployee Siminitus. Further, both USS foreman Yuhas and USS superintendent Seidenberger gave testimony contrary to the aforementioned testimony given by Offenheiser. Seidenberger's testimony about USS's door repair program is supported by documentary evidence indicating USS did in fact replace doors and provide patching.

The Secretary's burden of proof under this standard is to show that emissions were not controlled to the maximum extent possible. Obviously, what is possible will depend upon the physical condition of the battery involved. The Secretary presented no evidence to show that the leaks could have been more effectively controlled by assigning more employees to patcher crews. Insofar as the replacement of doors is concerned, USS's facility only had the capability to repair and replace two doors every 16 hours. Exhibit R-14 shows that, generally speaking, doors were in fact replaced at about this level of frequency, although the frequency of actual replacement declined in 1977, as the projected time for the entire battery rehabilitation approached. In this regard, Seidenberger testified that because of the deteriorated condition of the battery, changing doors would not have materially reduced emissions anyway. Because Chairman Rowland does not construe the standard to require measures which would not reduce emissions, he would not penalize USS for electing not to change doors in view of its impending battery rebuild. Furthermore, Chairman Rowland notes that were it not for intervening factors beyond USS's control, like a brick shortage and an exceptionally cold winter, USS's rehabilitation program would have been in progress at the time of the Secretary's inspection.

Citation 1, Items 10 and 11 and Citation 2, Items 11, 12, 13a ,13b

A

All these items involve different subsections within section 1910. 1029(f)(3)(iv)'s maintenance and repair procedures.[16/]

---

16/ The standard at section 1910.1029(f)(3)(iv) reads, in pertinent part:

§ 1910.1029 Coke oven emissions.

* * *

(f) Methods of compliance.

* * *

(3) Work practice controls.

* * *

(iv) Maintenance and repair. The employer shall operate existing coke oven batteries pursuant to a detailed written procedure of maintenance and repair established and implemented for the effective control of coke oven emissions consisting of the following elements:

(a) Regular inspection of all controls, including goosenecks, standpipes, standpipe caps, charging hold lids and castings, jumper pipes and air seals for cracks, misalignment or other defects and prompt implementation of the necessary repairs as soon as possible;

* * *

(c) Regular inspection of the damper system, aspiration system and collector main for cracks or leakage, and prompt implementation of the necessary repairs;

* * *

(e) Prevention of miscellaneous fugitive topside emissions;

* * *

(i) Repairs instituted and completed as soon as possible, including temporary repair measures instituted and completed where necessary, including but not limited to:

(1) Prevention of miscellaneous fugitive topside emissions.

The Secretary alleges in citation 1, item 10 and citation 2, item 12, that USS did not regularly inspect and promptly repair the cracks and leakage in its damper system, aspiration system, and collector main, thereby failing to comply with the maintenance and repair work practice control set forth at section 1910.1029(f)(3)(iv)(c).

The judge affirmed, finding that USS's repair program for certain components of the collector main, the Corliss valves,[17/] was not adequate because effective repairs were not promptly made. He assessed $1000 penalties for each item.

In citation 1, item 11 and citation 2, item 13b, the Secretary alleges that USS failed to comply with section 1910.1029(f)(3)(iv)(i)(1) at both batteries in that repairs were not instituted and completed as soon as possible for the prevention of miscellaneous fugitive topside emissions. In citation 2, item 13a, the Secretary alleges noncompliance with section 1910.1029(f)(3)(iv)(e) in that coke oven battery 2 was not operated under a detailed written procedure of maintenance and repair established and implemented to prevent miscellaneous fugitive topside emissions.

The judge ruled that the evidence established noncompliance with the cited standards as alleged. He assessed a $1000 penalty for item 11 in citation 1 and a $1000 penalty for item 13 (a and b) in citation 2.

The judge accepted as reasonable the Secretary's interpretation of "miscellaneous fugitive topside emissions," i.e., any coke oven emissions

---

17/ Corliss valves are housed between the goosenecks and the collector mains, and function as part of the damper system to stop gases from going into the collector main.

"from a source not specifically covered by the standard," including emissions leaking from either door frames or standpipes and rising to the topside of the ovens. He found that, as to battery 1, the evidence establishes that the door frames on ovens B-12, B-13, and C-12 were leaking emissions for weeks and could have been replaced in four or five days, and that the standpipe on the coke side of oven A-5 had also been leaking for weeks and could have been repaired in four hours.

As to battery 2, the judge found that the push side standpipe caps on ovens C-1, C-3, C-5, C-26 and C-27 were all leaking emissions at least one or more hours after charging, and that the door frame on oven B-26 had been broken and leaking emissions for about six months. He also found that the coke side oven door frames on ovens B-8 and B-14 were broken and leaking emissions.

In citation 2, item 11, the Secretary alleges that at battery 2 USS failed to regularly inspect and promptly repair cracks, misalignment, and other defects in goosenecks, standpipes, standpipe caps, charging hole lids, and castings, as required by section 1910.1029(f)(3)(iv)(a).

The judge, finding that USS had failed to promptly repair certain leaking standpipes and goosenecks, affirmed the item and assessed a $1000 penalty. He found that the standpipe on the coke side of oven B-9 was misaligned, and that this condition had developed over a six-month period; the condition could have been corrected in about four hours. He also found that the goosenecks on the coke sides of ovens B-8 and B-9 and the push side of oven C-29 had been leaking for over a month; they could all have been replaced or repaired in four or five hours.

B

USS contends that the judge based his findings of noncompliance for these five items on the word of certain employees who testified that noncomplying emissions had existed over a period of time. USS points out, however, that the judge indicated in his decision that he was discrediting the testimony of those same employees. USS also contends that CO Stranahan did not have personal knowledge of the length of time the emissions continued and had to rely, for his conclusion that the leaks had continued for a long time, on the testimony of employee Offenheiser and other employees. USS suggests, therefore, that since these items cannot be affirmed without testimony showing that leakage had existed over a period of time, the items should be vacated. USS contends that it did indeed prove it had both an inspection and corrective action program. It also contends that there is nothing in the cited standard which requires a coke oven operator to make permanent, as opposed to temporary, repairs of a condition, so long as the operator is taking action to eliminate emissions.

With specific reference to citation 2, item 13a, USS asserts that the CO testified he based this item on the fact that luting materials had not been applied to seal leaking standpipes even though the standpipes had only been leaking since the ovens had been charged. USS argues that its job procedures for lidmen called for standpipe lids to be luted and that just because one of its employees had not done his job that day is no reason for this citation item to be affirmed. USS states that there were buckets of luting material available for the lidman to use on the day of inspection, and that it had issued a written warning to

a lidman for failure to lute an emissions source. USS also states that the judge improperly focused on the fact that USS did not require its lidmen to lute standpipe lids until sometime after mid-January 1977 and that therefore the judge was condemning it for not having complied with the 1971 standard.

USS also argues that citation 1, item 11 and citation 2, item 13 should be dismissed as duplicative of the door emissions charges in citation 1, item 8 and citation 2, item 9. It states CO Stranahan testified that the sources of these emissions, with one exception,[18/] were all door frames. It then claims that the CO admitted that the door frame emissions upon which he based these items had also been used by him in citing USS for failing to maintain a door emission control corrective action program. The Secretary, USS states, attempts to justify this action on the ground that door frames or door jambs are not included in the door emission corrective action program. Yet, USS points out that section 1910.1029(f)(3)(ii), which deals with door requirements, specifically covers oven doors, chuck doors and door frames (jambs), and that the coke oven standard's preamble, at 41 Fed. Reg. 46766, states that the "door emission control program includes appropriate maintenance and repair of the metal components on the ovens, the doors and their components (emphasis supplied by USS), door handling machinery and inspection and cleaning methods." Thus, USS argues, door jamb emissions are covered under the door emission section and not

---

18/ One cited emission (citation 1, item 11) emanated from a standpipe in battery 1. USS argues that if the Commission agrees with it that there is only one battery here and that citations 1 and 2 should therefore be combined, this item more properly belongs under the allegations made in citation 2, item 11 dealing specifically with standpipe emissions.

the miscellaneous fugitive topside emissions section. Indeed, USS contends, even the Secretary finally conceded that his interpretation of the terms "miscellaneous fugitive topside emissions" was incorrect when he stated at closing argument:

> However, in following a philosophy of fundamental fairness, we don't wish to try to cite Respondent two times for the same problem in that abatement is only needed to be established once, and we would be relying on the door frames in view of the fact that we don't believe that may be otherwise covered.

USS also contends that the miscellaneous fugitive topside emissions standard is impermissibly vague, since not even the CO knew the meaning of the disputed terms.

The Secretary argues, with respect to citation 1, items 10 and 11 and citation 2, items 11-13, that USS's primary means of attempting to stop the leakage of defective Corliss valves, standpipes, goosenecks and door frames was to apply luting material. The method was not successful, the Secretary contends, because USS did not have enough employees luting to fully alleviate the emissions problem. Further, the Secretary adds, the patchers assigned to luting were often spending so much time trying to deal with the many leaking coke oven doors that they were unable to lute emissions sources on the topside of the batteries like Corliss valves, standpipes or goosenecks.

The Union states that, contrary to USS's argument, the CO did not base his testimony solely upon the employee representative's statements. Instead, the CO's practice was to record a particular time estimate if the employee representative's estimate was concurred in by the accompanying employer representative. When there were differing time estimates, the CO would record a figure representing a compromise between the

estimates of the two representatives. The Union also disputes USS's contention that repair work was being done promptly under its maintenance program.

C

The Commission vacates item 11 in citation 1 and items 13a and 13b in citation 2 but is divided in its action on item 10 in citation 1 and items 11 and 12 in citation 2. To the extent item 11 in citation 1 and item 13a and 13b in citation 2 (failure to prevent "miscellaneous fugitive topside emissions") are directed at emissions through door frames, both Chairman Rowland and Commissioner Cleary vacate those items as duplicative of item 8 in citation 1 and item 9 in citation 2, as discussed above. Emissions caused by door frame/door jamb leakage are more specifically covered by section 1910.1029(f)(3)(ii)(d)'s "door emissions" language, than by the fugitive emissions language of section 1910.1029(f)(3)(iv)(a) and (i)(1). To the extent item 11 in citation 1 and items 13a and 13b in citation 2 are directed at emissions through standpipes and standpipes caps, Commissioner Cleary would vacate those items as duplicative of item 11 of citation 2, discussed below. Emissions caused by standpipes and standpipe caps are more specifically covered by section 1910.1029(f)(3)(iv)(a).

With respect to item 10 in citation 1 and item 12 in citation 2 (failure regularly to inspect and repair damper systems, aspiration systems, and collector mains for cracks or leakage) and item 11 of citation 2 (failure regularly to inspect and repair all controls, including standpipes and standpipe caps for cracks, misalignment or other defects), Commissioner Cleary would affirm and Chairman Rowland would

vacate. Commissioner Cleary acknowledges Judge Brennan's action in reducing the weight given to employee Offenheiser's testimony and therefore would base his affirmance of these items on the testimony of compliance officer Stranahan, who testified that certain certain Corliss valves had been leaking for over a month and that certain standpipe caps had been leaking for three to fifteen hours. Commissioner Cleary observes that the substantial number of emission leaks is plainly documented by the photographic exhibits and that four to six workers, one shift per day, are not adequate to assure a regular program of inspection and repair for 174 ovens operating seven days a week, twenty-four hours a day.

Chairman Rowland would vacate all three of these latter items (item 10 in citation 1 and items 11 and 12 in citation 2) concerning alleged defects in USS's inspection, maintenance, and repair program because the record clearly shows that USS did have an ongoing inspection and corrective action program and, as a result, only a very small number of Corliss valves, standpipes, standpipe caps, and goosenecks were observed to have defects. The judge relied on evidence showing that only four Corliss valves were or had been leaking prior to the inspection, yet there were a total of 174 such valves in both batteries. Only two standpipes and five standpipe caps were shown to be leaking out of all those used with USS's coke ovens. Just three goosenecks were found to be defective at the time of inspection out of 174 goosenecks. Chairman Rowland would conclude, therefore, that the fact that the number of leaking Corliss valves, standpipes, standpipe caps, and goosenecks was so small actually establishes the adequacy of USS's repair program.

Further, the Chairman would observe that USS's repair program depended on the actions of its employees who did the inspecting, maintaining, and repairing of the different component parts of the battery. Chairman Rowland does not require that an employer insure against every instance of employee noncompliance with an established safety program. Borton, Inc., 82 OSAHRC 17/E13, 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,983 (No. 77-2115, 1982) (Rowland, Chairman, disenting), appeal filed, No. 82-1661 (10th Cir. May 26, 1982)

Chairman Rowland would further observe that the Secretary has not shown that necessary repairs to Corliss valves were not implemented as promptly as required by standard. Section 1910.1029(f)(3)(iv)(i)(1), note 16 supra, specifies the timing for the institution of necessary repairs. As the preamble to the coke oven standard indicates, that section requires repairs be instituted as soon as possible and that temporary repairs be completed before the charging of the ovens for the next coking cycle takes place. See 41 Fed. Reg. 46769.[19/] There is no

---

19/ The pertinent section of the preamble reads:

> [Section 1910.1029(f)(3)(iv)(i)] requires that repairs shall be instituted as soon as possible. This is based on evidence in the record which indicated that there is no set time frame applicable to these repairs but rather, because some repairs may require replacement or rebuilding of battery components over a substantial period of time. . . . However, since any delay in the implementation of these repairs can effect employee exposure to coke oven emissions, e.g. leaks from standpipes, chuck doors, or oven brickwork, the standard requires that temporary repair measures be instituted prior to charging the oven for the next coking cycle. Examples of the types of repairs contemplated by his section are luting, sealing, or welding of offtake equipment leaks, or

(continued on next page)

evidence that USS failed to treat leaking Corliss valves prior to charging the ovens for the next cycle. With respect to the standpipes that the judge found were leaking and which he believed could have been replaced in four hours, Chairman Rowland would point out that, contrary to the judge's latter conclusion, Yuhas testified without contradiction that the deteriorated bases of the standpipes were caused by a shift in the battery's collector main and that the leakage problem could only be corrected by rehabilitation of the entire battery. Finally, with respect to the one gooseneck about which Offenheiser testified that permanent repairs were necessary, the preamble expressly states that permanent repairs do not necessarily have to be completed within any particular period of time. Therefore Offenheiser's testimony alone is not sufficient to show that USS's repair program was inadequate. There is no evidence showing when the condition of this gooseneck was first detected or showing that the gooseneck would not have been temporarily repaired again once detected. Accordingly, Chairman Rowland would vacate these items.

---

19/ (continued)

> installation of chuck door gaskets. . . . While industry representatives generally stated that immediate repairs are not possible, that factor must be balanced against the risk of continued employee exposure in setting a time frame for control of these emissions. Therefore, while acknowledging that permanent repairs may not be capable of immediate implementation, the standard requires both temporary and permanent repairs to be performed as soon as possible.

Citation 3, Item 1a, b and c

Item 1a of serious citation 3 alleges noncompliance with section 1910.134(f)(2)(i),[20/] as adopted by section 1910.1029(g)(3),[21/] in that all respirators at batteries 1 and 2 were not routinely inspected before and after each use. Item 1b alleges noncompliance with section 1910.134(f)(3),[22/] as adopted by section 1910.1029(g)(3) in that provisions

---

20/ The standard at section 1910.134(f)(2)(i) provides:

§ 1910.134 Respiratory protection.

* * *

(f) Maintenance and care of respirators.

* * *

(2)(i) All respirators shall be inspected routinely before and after each use. A respirator which is not routinely used but is kept ready for emergency use shall be inspected after each use and at least monthly to assure that it is in satisfactory working condition.

21/ The standard at section 1910.1029(g)(3) provides:

§ 1910.1029 Coke oven emissions.

22/ (continued)

(f) Maintenance and care of respirators.

* * *

(3) Routinely used respirators shall be collected, cleaned, and disinfected as frequently as necessary to insure that proper protection is provided for the wearer. Each worker should be briefed on the cleaning procedure and be assured that he will always receive a clean and disinfected respirator. Such assurances are of greatest significance when respirators are not individually assigned to workers. Respirators maintained for emergency use shall be cleaned and disinfected after each use.

23/ The standard at section 1910.1029(g)(2)(i) provides:

§ 1910.1029 Coke oven emissions.

* * *

(g) Respiratory protection --

* * *

(2) Selection. (i) Where respirators are required under this section, the employer shall select, provide and assure the use of the appropriate respirator or combination of respirators from Table I below. . . .

The judge ruled that the evidence established noncompliance with 1a, b, and c as alleged. He found the proposed $1000 penalty excessive and assessed $500.

The judge found that USS's respirator training program consisted solely of a slide presentation that was shown to employees. The presentation did not, however, make it clear to employees that the respirators each employee was provided with had to be routinely inspected before and after each use; as a consequence, the employees did not routinely inspect their respirators. Further, the judge stated, employees were observed who were not wearing properly fitted respirators and 50 per cent of the coke oven workers, as well as 25 per cent of the foremen or supervisors, were not wearing respirators at all times within areas designated for their use.

The judge also found that the respirators were neither collected, cleaned nor disinfected by USS, but that these tasks were delegated to individual employees. He stated that USS's training program made no specific mention of cleaning or disinfecting respirators, and that USS's training program was deficient in not instructing employees on how to clean or disinfect their respirators. The judge also stated the evidence established that the employees mentioned in item 1c were not properly wearing their respirators.

USS argues, with respect to item 1a on the alleged failure of employees to routinely inspect their respirators after each use, the Secretary failed to carry his burden of proving noncompliance. It contends evidence it submitted contains detailed instructions for the inspection and cleaning of respirators before and after each use, and employee

Lepionka testified he checked his respirator before using it. USS also contends the judge's finding that employees did not wear respirators at all times does not establish a failure to inspect the respirators before and after each use. Further, USS argues, foreman Yuhas' testimony that he occasionally observed employees wearing respirators whose straps had lost their elasticity does not establish that the straps had failed prior to use, and use of such respirators does not indicate noninspection, since the straps could have lost their elasticity while the respirator was being worn.

With respect to item 1b on the alleged failure to provide for the collection and cleaning of respirators, USS argues the judge affirmed this item because USS's training program did not require the cleaning and disinfecting of respirators and because some employees only disinfected their respirators eight times a year. USS argues, however, that the judge did find that USS provided both Calgon soap and a disinfecting agent for its employees and that the collection and cleaning of respirators was unnecessary because each employee had his own respirator.

With respect to item 1c on the alleged failure to select and assure the use of appropriate required respirators, USS argues that this item is duplicative of item 1a in citation 4.

The Secretary argues the evidence clearly establishes that employees, even employee Lepionka, did not systematically inspect their respirators for defects prior to each use. The Secretary also agrees with the judge's finding that USS did not provide guidance to its employees on how to conduct routine inspections of their respirators.

The Secretary also argues the Commission should correct an oversight of the judge and affirm subparts a and b of item 1c. The Secre-

tary contends the judge inadvertently vacated all of item 1c in the order section at the end of his decision after the parties stipulated to vacate only subpart c of item 1c, and after the judge had affirmed subparts a and b of item 1c in the body of his decision.

The Union argues USS had only a paper respiratory program that never operated in fact. It claims "[t]he most vivid illustration of the divergence between the paper program and the actions of Respondent" is in the introductory paragraph to USS's training program slide presentation which refers to the 1977 standard as a "law . . . imposed by the Occupational Safety and Health Administration upon all people who work in coke plants throughout the United States."

The Union contends neither supervisors nor employees were sufficiently trained to be able to implement the requirements in USS's respirator training program. One employee was not convinced that after 25 years of work on the coke ovens a respirator would be of any use to him. Further, although USS did verbally warn employees to use respirators, it did nothing to solve the difficulties encountered in trying to use respirators while talking or while working in extreme heat.

The Union also contends USS allowed its employees to dispense with respirator use in the foreman's office at bench level between the outer walls of the batteries even though the standard required respirator use there. This exception to the standard's requirements, the Union alleges, further contributed to employee opposition to the respirator requirement.

The Commission is divided in its decision on these subitems. Commissioner Cleary would affirm subitems 1a and 1b for the reasons advanced by the judge. Further, with respect to subitem 1b, Commissioner

Cleary would find that section 1910.134(f)(3) is plainly worded to require the collecting, cleaning and disinfecting of respirators even when those respirators are assigned for the use of particular employees.

Chairman Rowland would vacate subitems 1a and 1b. Although the ALJ relied in affirming subitem 1a on the fact that the slide program USS showed its employees on safety did not specify that respirators had to be inspected before and after each use, Chairman Rowland rejects the judge's action because he does not find evidence that the slide program was the only training given to employees. In fact, employee Lepionka stated that he checked his respirator prior to each use, that he would adjust his respirator if it was leaking, and that he had always been able to eliminate leaks by adjusting the respirator. Lepionka also testified that he would clean his respirator at the beginning of each day, that he would insert a new filter if required, and that he could tell if his respirator was malfunctioning. Chairman Rowland also observes that section 1910.134(f)(2)(i) does not specify the scope or nature of the required inspection. Since the Secretary did not present any evidence to show that the inspection as performed by Lepionka was not sufficient to detect defects affecting the proper operation of the respirator, Chairman Rowland would vacate subitem 1a.

Similarly, Chairman Rowland would vacate subitem 1b. Once again, the judge, in affirming, improperly focused on the supposed defects in USS's formal training program instead of giving proper significance to the program's substance. See Jones & Laughlin Steel Corp., 82 OSAHRC , 10 BNA OSHC 1778, 1982 CCH OSHD ¶ 26,128 (No. 76-2636, 1982). Yuhas testified that he instructed employees on how to clean and disinfect respirators and, indeed, the judge conceded that USS made cleaning

and disinfecting material available to employees and Yuhas and his crew disinfected their respirators eight times a year. There is no evidence to show that more frequent disinfecting was necessary to insure proper protection for employees. Lepionka testified that he had been instructed regarding cleaning and, as mentioned above, Lepionka also testified that he cleaned his respirator daily. Accordingly, the judge's findings are contrary to the record and subitem 1b should be reversed.

With respect to subitem 1c, Commissioner Cleary would affirm the subitem and Chairman Rowland would vacate it. Commissioner Cleary would affirm citation subitem 1c because two of the Secretary's industrial hygienists who inspected the worksite testified they had observed three different employees working in the midst of visible emissions while not wearing respirators. Commissioner Cleary rejects USS's argument that subitem 1c of citation 3 is duplicative of item 1a in citation 4. As will be discussed below, the latter item requires a determination of whether USS had a systematic inspection program to assure that respirators were properly selected, used, cleaned, and maintained. Item 1c of citation 3, as mentioned above, was proven by the showing that employees worked in visible emissions without respirators. Finally, Commissioner Cleary would correct the judge's action inadvertently vacating all of item 1c in the order section of the judge's decision. The judge's order should properly show, as does the body of his decision, that subparts a and b of subitem 1c are affirmed, while only subpart c of subitem 1c is vacated.[23a/]

Chairman Rowland would vacate the subitem because he finds that USS's program to assure the use of respirators was adequate. The record

---

23a/ Chairman Rowland agrees that this clerical correction should be made but vacates subparts a and b on the merits for the reasons that appear in the text.

shows that USS prepared and presented a slide program to its employees emphasizing that respiratory protection would be provided and required. Foreman Yuhas testified that he began enforcing the use of respirators in 1976-77 under the new coke oven standard. He testified that he would inform an employee not wearing a respirator to put one on unless the employee had removed his respirator to speak to another employee.[24/] Yuhas characterized his actions in requiring employees not wearing respirators to put them on as verbal reprimands and stated that because such actions resulted in the employees replacing their respirators, he saw no need for more severe discipline. He concluded that 50 per cent of the employees customarily wore their respirators at all times, other than when it was necessary to remove them.

Tellado, another foreman, stated that as a nonsupervisory employee he had been told to put his respirator on by a supervisor who observed him not wearing it. As a supervisor, Tellado testified, he in turn gave the same admonition to employees under him. As did Yuhas, he estimated that 50 per cent of the employees wore respirators on a regular basis without intervention by the supervisors. Half of the remaining 50 per cent would comply with an instruction to put their respirators on; the balance of the employees tended to be somewhat resistant. In the few cases where verbal warnings had been ineffective, Tellado testified, he issued written warnings to the employees, who had then complied. Finally, employee Lepionka testified that he had been told to wear a

---

24/ Compliance officer O'Malley testified that an employee would have to remove his respirator to talk. The preamble to the coke oven standard recognizes that the need to communicate to insure safe work operations is a limiting factor in the wearability of respirators. See 41 Fed. Reg. at 46773.

respirator while working on the coke oven battery and had worn one "most" of the time, but not when he had to remove the respirator to communicate with a co-worker.

Although two other employees, Siminitus and Offenheiser, also stated that they had been told to wear respirators while working on the battery, both in their testimony disputed the effectiveness of USS's respirator program. Chairman Rowland notes, however, that in response to USS's argument regarding the credibility of the Secretary's witnesses the judge found Siminitus and Offenheiser to be biased and concluded that because of inconsistencies in their testimony it was not entitled to dispositive weight. Accordingly, the Chairman finds no evidence to rebut USS's showing that it took adequate steps to assure that its employees wore respirators.[25/]

Chairman Rowland's conclusion that these items should be vacated is reinforced by the fact that the coke oven standard provides a grace period for the implementation of a respirator program. With the exception of employees located "in the vicinity of visible emissions," the wearing of respirators was voluntary until January 20, 1978 under section 1910.1029(g)(1)(ii). The preamble to the coke oven standard explains that

> it is necessary to mitigate some of the problems associated with implementing a program of respira-

---

25/ Chairman Rowland does not now find it necessary to consider the propriety of Commission precedent giving an employer the duty to enforce as well as to communicate work rules to employees. For a discussion of the question whether an employer should be required to do anything more than give instructions to employees regarding the proper use of safety equipment, see General Electric Co. v. OSHRC, 540 F.2d 67, 69 (2d Cir. 1976); Borton, Inc., supra.

> tory protection such as the fitting and training of employees. . . . The proposal required use of respirators whenever employees were exposed in excess of the permissible exposure limit. This would have essentially required the wearing of respirators by large numbers of coke oven workers for the entire work shift. The one-year period of voluntary respirator use will alleviate this burden while the necessary adjustments for implementation of a respirator program are made.

41 Fed. Reg. at 46775. Since the inspection at issue in this case occurred early within the one-year voluntary period, the degree of efforts undertaken by USS to require respirators to be worn is consistent with the gradual implementation of a respirator program envisioned by the Secretary. Since there is no question that USS selected and provided an appropriate type of respirator,[26/] Chairman Rowland finds that USS complied with the requirements of cited section 1910.1029(g)(2)(i). Chairman Rowland moreover would specifically disavow the gratuitous remark made by the judge that "visible emissions existed . . . throughout the regulated areas at the batteries." (JD 64, n. 20) The Chairman finds the quoted remark not only unsupported by the evidence of record, but also contrary to the Secretary's allegation that visible emissions existed at only a few employee work stations.

Citation 3, Item 2

The Secretary alleges USS failed to comply with the standard at section 1910.1029(h)(2)(vi)[27/] in that persons who cleaned or laundered the

---

26/ There is no dispute that respirators were adequate to protect employees from emissions levels up to 1500 ug/m3. The Secretary does not contend that emissions levels in the ambient air exceeded this level.

27/ The standard at section 1910.1029(h)(2)(vi) reads:

§ 1910.1029 Coke oven emissions.

(continued on next page)

protective clothing required by the cited section were not informed of the potentially harmful effects of exposure to coke oven emissions. The citation specifies in subsections a and b of item 2 that the persons involved were (a) the families of employees in coke oven batteries 1 and 2 and (b) the employees of Arrow Uniform Services Division of Work Wear Corporation. A $1000 total penalty was proposed.

Judge Brennan found the evidence established noncompliance with the cited standard and assessed a total penalty of $1000. With respect to the allegation in subpart a, the judge found USS did not inform its employees of the hazards in handling emissions-contaminated work clothes when, between January 20, 1977 and April 2, 1977, employees took their clothing home for laundering. The judge concluded that if the employees had been warned about the hazards they in turn would have warned their wives about them and thus protected their wives and children. The judge also inferred that some of the employees may have laundered their own emissions-contaminated clothing.

With respect to subpart b, the judge acknowledged USS's April 3, 1977 contract with Arrow Uniform Service for the laundering of protec-

27/ (continued)

* * *

(h) Protective clothing and equipment.

* * *

(2) Cleaning and replacement

* * *

(vi) The employer shall inform any person who cleans or launders protective clothing required by this section, of the potentially harmful effects of exposure to coke oven emissions.

tive clothing contaminated with coke oven emissions. He noted that the purchase order for the laundering contained the following statement in capital letters:

> This order is notification to vendor that the protective clothing to be laundered has been used in regulated areas of U.S. Steel's coke oven operations and is designated contaminated from exposure to coke oven emissions and may cause potentially harmful effects such as described in the OSHA standard covering coke oven emissions (29 C.F.R. § 1910.1029), effective January 20, 1977.

The judge found that the above paragraph did not notify Arrow of <u>what</u> the potentially harmful effects were, and was therefore inadequate. The judge concluded that the evidence fails to show USS advised Arrow either that skin cancer was a possible hazard, or that there were increased risks of lung and genito-urinary cancer.

The judge rejected USS's arguments that since the preamble to the emissions standard declares there is no clearly demonstrated excess mortality from skin cancer in coke oven workers and also provides that the word cancer is not required to appear on the label affixed to laundry bags of contaminated clothing, the purchase order statement referred to above is more than sufficient. The judge stated that even though the word cancer is not required on laundry labels, cancer risk information should be conveyed to persons handling contaminated clothing. "Otherwise," the judge continued, "the cited provision of the standard is not only meaningless, but a rather cruel exercise in double talk . . ."

The judge also rejected USS's argument that any provision of the standard which purports to cover a nonemployee is juricdictionally beyond the provisions of the Act. . . ." The judge stated that USS was required to inform its own employees of the hazard and that if they had

been so informed they would have warned their wives. He stated that the wives of the employees stood in essentially the same position as Arrow Laundry, and that USS was obligated to warn Arrow of the hazards because Arrow was its subcontractor.

USS argues in its review brief that the judge found USS guilty of a violation with which it was not charged when he found it had not told its employees of the hazards of contaminated clothing. Subpart a of this citation item, USS points out, refers only to the "families of employees." USS admits it did not give notice to family members but contends that the standard may not be validly interpreted to require notice to either a nonemployee or the employee of another person. USS states that the Secretary did not intend for notice to go to nonemployees because the Secretary required employers to launder emissions-contaminated clothing by section 1910.1029(h)(2)(ii), which provides: "The employer (emphasis supplied) shall clean, launder, or dispose of protective clothing required by paragraphs (h)(1)(i) and (ii) of this section."

With respect to the sufficiency of its notice to Arrow Uniform Services, USS reiterates the preamble's passages mentioned above concerning the unlikely possibility of coke oven workers contracting skin cancer and the lack of a requirement to put the word cancer on the labels of laundry bags containing contaminated clothing. It then asserts, in contending that its notice to Arrow was sufficient, that the containers for laundry sent to Arrow were affixed with proper notice under the cited standard, i.e., "Caution. Clothing Contaminated with Coke Emissions. Do Not Remove Dust by Blowing or Shaking." USS also contends that further notice of the contaminated nature of the clothing was contained in

the purchase order referred to above as set out in the stipulations of the parties. Finally, USS asserts that management official Seidenberger told one of Arrow's officials that the clothing was contaminated, and that Seidenberger even thought he used the terms "cancer threat."

The Secretary argues that the intent of the cited standard is to apprise persons of the nature of the hazard to which they are potentially exposed so that they will use greater care in handling contaminated clothing. He asserts the information given to Arrow by USS was meaningless in apprising Arrow's employees of the need to handle the clothing with greater care. He argues that even though the preamble to the coke oven standard does not require use of the word cancer on the labels of laundry bags, USS was still required to inform the employees who cleaned contaminated clothing that they were being exposed to a carcinogenic hazard.

The Commission affirms subpart a and vacates subpart b of citation 3, item 2. With respect to subpart a, the parties' stipulation establishes that at least some USS employees took their contaminated clothing home for laundering. Testimony also shows that some employees were not warned of the potentially harmful effects of laundering their contaminated clothing. We agree with the judge that informing employees of this hazard would have been equivalent to warning the families of those employees. Therefore, although the allegation in the citation is made as to the "[f]amilies of employees," this allegation is sufficiently broad to encompass the employees themselves. Because the Commission's finding of noncompliance is based on USS's failure to warn its own employees, the Commission does not reach USS's argument that the

cited standard may not validly refer to "any person." We assess a $250 penalty for noncompliance with subpart a of item 2.

The Commission vacates subpart b because USS did comply with the cited standard by USS's purchase order statement and the notice it affixed to the laundry containers, as quoted above. Although USS might have drafted warning notices more explicitly dwelling on cancer and carcinogens, the Commission finds, in light of the sections cited by USS from the preamble at 41 Fed. Reg. 46747-48 and, particularly, 46781, the notices USS did provide were sufficient.

Citation 3, Item 3

The Secretary alleges that USS failed to comply with section 1910.1029 (i)(3)[28/] in that the old lunchroom located at bench level between coke oven batteries 1 and 2 did not have a temperature controlled, positive pressure, filtered air supply. The penalty proposed was $1000.

---

28/ The standard at section 1910.1029(i)(3) reads:

§ 1910.1029 Coke oven emissions.

* * *

(i) Hygiene facilities and practices.

* * *

(3) Lunchrooms. The employer shall provide lunchroom facilities which have a temperature controlled, positive pressure, filtered air supply, and which are readily accessible to employees working in the regulated area.

USS admits it did not provide a temperature controlled, positive pressure, filtered air lunchroom but contends that the item should be vacated because it did not have sufficient time to do so. USS argues that it diligently attempted to comply with section 1910.1029(i)(3). In December of 1976, USS decided to build a new lunchroom equipped with an air filtered unit in its roof. This decision was subsequently implemented by the following steps: the preparation of design drawings for the new lunchroom, requests made to suppliers on the availability of air filtered units, price quotations received from suppliers, advice requested from USS headquarters on special filtered units, invitations to bid extended to four suppliers, environmental control equipment ordered from supplier Busch, approval of Busch's drawings, and repeated contacts made with Busch to determine why the ordered equipment had not been sent. Busch had the order for an air filtered unit for about eight months without managing to fill it, USS states.

The judge found the evidence established noncompliance and assessed a $500 penalty. He cited the parties' stipulation that the old lunchroom did not have positive pressure, temperature controlled, filtered air at the time of the inspection, and that it was technically feasible to install such a system in the new lunchroom, which had replaced the old one on May 20, 1977. The judge found that, even though USS decided in December of 1976 to build a new lunchroom, when the new lunchroom was finally built, after a long series of design changes and delays, it too was without filtered air. The judge concluded USS "obviously did not consider this employee protective device something which should have been expedited," and if USS had been interested in expediting the matter

it might have called for copies of the plans and specifications of the environmentally controlled lunchrooms at its plants in Fairfield, Alabama; Gary, Indiana; or Clairton, Pennsylvania.

In response to the judge's statement about its failure to study the plans of similar lunchrooms at other USS plants, USS contends that the statement ignores unrefuted testimony of its engineer Orloski, who testified that in ordering the filtered air unit for the lunchroom, he was acting on the advice of officials in USS's Pittsburgh headquarters who were seeking the best units for all of USS's coke operations. Therefore, USS argues, Orloski could have learned nothing further by either visiting the other plants or by examining the plans of their lunchrooms. USS further argues that each lunchroom has to be designed to fit the particular structure in question. Besides, USS continues, the major delay here was in acquiring the environmental control equipment from the supplier, and USS did not know what the judge expected it to do to expedite delivery from the supplier.

The Secretary argues that the technology to provide employees with a clean environment in which to eat had been available to USS since the early 1960's. He further argues that even though the cited standard is not specifically discussed in the coke oven emissions standard's preamble with respect to the "continuum of obligations" USS was under, USS must be held accountable for failing to comply with the cited standard because it had been obligated by the 1971 standard to implement all feasible controls.

We vacate this item. We reject the Secretary's argument that USS was required to provide an environmentally controlled lunchroom by the

1971 standard. First, as discussed above, the requirement of controls under the 1971 standard was triggered by excessive exposure to CTPV, and there is no evidence of such exposure. Second, the provision in section 1910.1029(f)(1)(i)(a) that requires the employer's obligation under the 1971 standard to be considered only applies to the controls listed in the subsections (f)(2), (f)(3), and (f)(4). The requirement for an environmentally controlled lunchroom is not found in those subsections.

Thus, whether USS may be found in violation of section 1910.1029 (i)(3) must be based on whether USS could have complied with the standard in the two-month period between the standard's effective date and the Secretary's inspection. We find that USS has established it could not have provided the required environmentally controlled lunchroom in that relatively short period of time. USS diligently took the series of steps listed above to achieve compliance with the cited standard. The fact that the diligence reflected by those steps was not successful in gaining compliance demonstrates that it was not possible to comply with the cited standard before the Secretary's inspection.

Citation 3, Items 4 and 5

Item 4 alleges USS's noncompliance with section 1910.1029(i)(4)(i)[29/] in that employees working in the regulated areas of coke oven batteries 1

---

29/ The standard at section 1910.1029(i)(4)(i) reads:

§ 1910.1029 Coke oven emissions.

* * *

(i) Hygiene facilities and practices.

(continued on next page)

and 2 did not wash their hands and face before eating. Item 5 alleges USS's noncompliance with section 1910.1029(i)(5)(i)[30/] in that USS did not assure that food and/or smoking products were not consumed in two different regulated areas, the old lunchroom and the topside of batteries 1 and 2. Penalties of $1000 for each item were proposed. USS moved to withdraw its notice of contest to the merits of these items, but did contest the penalties. The judge granted USS's withdrawal-of-contest motion and assessed the proposed $1000 penalties.

With respect to item 4, the judge acknowledged that USS's training program directed employees to wash their face and hands before eating, drinking, or using tobacco products after being in a regulated area, but stated that the directive was not enforced. He also stated that the

---

29/ (continued)

* * *

(4) Lavatories. (i) The employer shall assure that employees working in the regulated area wash their hands and face prior to eating.

30/ The standard at section 1910.1029(i)(5)(i) reads:

§ 1910.1029 Coke oven emissions.

* * *

(i) Hygiene facilities and practices.

* * *

(5) Prohibition of activities in the regulated area. (i) The employer shall assure that in the regulated area, food or beverages are not present or consumed, smoking products are not present or used, and cosmetics are not applied, except that these activities may be conducted in the lunchrooms, change rooms and showers required under paragraphs (i)(1)-(i)(3) of this section.

employees, including "foreman" Lepionka, did not always follow the directive. The judge further found that the lack of hot water during some periods in winter served to discourage employees from washing.

With respect to item 5, the judge also found that although USS did have a section of its training program drafted to obtain compliance with the cited standard, USS failed to establish enforcement of that section.

USS argues that the judge made two clearly erroneous factual findings in his consideration of the appropriate penalty figures: 1) although the judge found Lepionka was a foreman, Lepionka was only a bargaining unit employee, and 2) although the judge found that hot water was not always available, the evidence on the lack of hot water relates to a lavatory at the east side of the coke oven battery, quite distant from the lunchroom, and there is no evidence that employees used that particular lavatory prior to eating lunch. Both the Secretary and the Union argue that the judge's penalty assessments were proper.

We believe that the judge's penalty assessments are inappropriately high. With respect to item 4, the judge substantially downgraded USS's good faith as a result of his belief that employee Lepionka was a foreman. However, Lepionka was shown to be an employee but not a foreman. USS's contention that the judge's factual finding about the unavailability of hot water being clearly erroneous is rejected, however. Lepionka's testimony is that only cold water was provided for the wash facilities in the patcher's lunchroom located on the ground level between the two batteries. We assess a $150 penalty based on the low gravity of this violation.

With respect to item 5, a full page of text and two slides in USS's training program cautioned employees against eating and smoking in regu-

lated areas. This demonstrates a significant measure of good faith on USS's part even though enforcement of the smoking and eating prohibitions presented obvious difficulties among employees who found it difficult to refrain from smoking or eating over any extended period of time.[31/] The gravity of this violation was low, and we assess a $150 penalty.

Citation 3, Item 6b and 6c[32/]

Item 6b alleges noncompliance with section 1910.1027(f)(7)[33/] in that written procedures and schedules required under section 1910.1029 (f) were not incorporated into USS's information and training program mandated by section 1910.1029(k). Item 6c alleges noncompliance with

---

31/ Since USS contests only the penalties and not the merits of items 4 and 5, Chairman Rowland does not find it necessary to consider the propriety of Commission precedent giving an employer the duty to enforce as well as to communicate work rules to employees. See General Electric Co. v. OSHRC, supra; Borton, Inc., supra.

32/ The Secretary withdrew item 6a.

33/ The standard at section 1910.1029(f)(7) reads:

§ 1910.1029 Coke oven emissions.

* * *

(f) Methods of compliance.

* * *

(7) Training in compliance procedures. The employer shall incorporate all written procedures and schedules required under this paragraph (f) in the information and training program required under paragraph (k) of this section and, where appropriate, post in the regulated area.

section 1910.1029(k)(1)(iv)(d)[34/] in that USS's training program did not include a review of the following written procedures and schedules required by section 1910.1029(f):

a) the written inspection and cleaning procedure for each battery, as required by sections 1910.1029(f)(3)(i)(a)(1) - (7);
b) the written charging procedure for each battery, as required by sections 1910.1029(f)(3)(i)(b)(1) - (3);
c) the written procedures for the control of coke oven emissions during coking, as required by sections 1910.1029(f)(3)(ii)(a) - (e);
d) the written procedure for the control of emissions during pushing, as required by sections 1910.1029(f)(3)(iii)(b)(1) - (3);
e) the written procedure of maintenance and repair for coke oven batteries, as required by sections 1910.1029(f)(3)(iv)(a) - (i);
f) the written program and schedule to reduce exposures solely by means of engineering and work practice controls, as required by sections 1910.1029(f)(6)(i) and (ii)(a) - (e).

After comparing USS's training program with section 1910.1029(f), the judge found the program did not include the written procedures regarding work practice controls from the following parts of the standard:

1) section 1910.1029(f)(3)(i)(a)(1),
2) " " (2),
3) " " (5),
4) " " (7),

---

34/ The standard at section 1910.1029(k)(1)(iv)(d) reads:

§ 1910.1029 Coke oven emissions.

* * *

(k) Employee information and training — (1) Training program.

* * *

(iv) The training program shall include informing each employee of:

* * *

(d) A review of all written procedures and schedules required under paragraph (f) of this section. . .

5) section 1910.1029(f)(3)(i)(b)(1),
6) " " (2),
7) " " (3),
8) section 1910.1029(f)(3)(ii)(b),
9) " " (iii)(b)(1),
10) " " (iv)(a),
11) section 1910.1029(f)(6)(i),
12) " " (ii)(6)

He, therefore, found noncompliance with the cited standard and assessed a total penalty of $1000. In response to USS's argument that the deficiencies in its training program were corrected after the inspection, the judge stated that they were required as of the time of inspection.

USS admits that the initial version of its training program did not include all the required work practices, but it contends the September 20, 1977 revised version of its training program did. USS notes Seidenberger's unrebutted testimony that the more detailed information contained in the latter program was not included in the initial program because USS had not had time to write up all the operating procedures in question. According to USS, Seidenberger testified that its training program was not the only method used to train employees on the work practices required by the standard. Rather Seidenberger stated that employees were given standard operating procedures which described some of the work controls and that employees were also individually trained with respect to certain work practices through the use of safe job procedures. USS asks dismissal of these items on the basis of not having had adequate opportunity to comply with the requirements of the standards and of having made a good faith effort at compliance.

The Secretary points out that USS admits its original training program, in effect during the period of inspection, did not comply with section 1910.1029(k)(1)(iv)(d). In addressing USS's argument that the

defects in its training program were cured by other training methods, such as its standard operating procedures, the Secretary contends that these procedures were not communicated to the employees in any systematic fashion that would indicate all employees received such communications.

We vacate items 6b and 6c. USS has established that it did not have sufficient time to comply with the cited standards. Section 1910.1029(f) encompasses more than 525 lines of regulations in the Code of Federal Regulations. Although USS made good faith efforts at compliance, USS could not realistically have incorporated into its training program by the time of inspection all the written procedures and schedules, together with a review of these procedures and schedules, required under section 1910.1029(f). Chairman Rowland further concludes, for the reasons stated in his discussion of items 8, 10, and 11 of citation 1 and items 9, 11-13 of citation 2, supra, that USS adequately implemented its program for controlling coke oven emissions.

Citation 4, Items 1a and 1b

Item 1a alleges USS's failure to comply with section 1910.134(e)(4),[35/] as adopted by section 1910.1029(g)(3),[36/] in that frequent ran-

---

35/ The standard at section 1910.134(e)(4) reads:

§ 1910.134 Respiratory protection.

* * *

(e) Use of respirators.

* * *

(4) Respiratory protection is no better than the respirator in use, even though it is worn conscientiously. Frequent random inspections shall be conducted by a qualified individual to ensure that respirators are properly selected, used, cleaned, and maintained.

36/ The standard at section 1910.1029(g)(3) reads:

(continued on next page)

dom inspections were not conducted by qualified individuals to assure that respirators were properly selected, used, cleaned, and maintained.

Item 1b alleges USS's failure to comply with section 1910.134(e)(5)(i),[37/] as adopted by section 1910.1029(g)(3), in that every respirator

---

36/ (continued)

* * *

(g) Respiratory protection.

* * *

(3) Respirator program. The employer shall institute a respiratory protection program in accordance with section 1910.134 of this part.

37/ The standard at section 1910.134(e)(5)(i) reads:

§ 1910.134 Respiratory protection.

* * *

(e) Use of respirators.

* * *

(5) For safe use of any respirator, it is essential that the user be properly instructed in its selection, use, and maintenance. Both supervisors and workers shall be so instructed by competent persons. Training shall provide the men an opportunity to handle the respirator, have it fitted properly, test its face-piece-to-face seal, wear it in normal air for a long familiarity period, and, finally, to wear it in a test atmosphere.

(i) Every respirator wearer shall receive fitting instructions including demonstrations and practice in how the respirator should be worn, how to adjust it, and how to determine if it fits properly. Respirators shall not be worn when conditions prevent a good face seal. Such conditions may be a growth of beard, sideburns, a skull cap that projects under the facepiece, or temple pieces on glasses. Also, the absence of one or both dentures can

(continued on next page)

wearer was not given demonstrations and practice in how respirators should be worn, and was not given instructions in how respirators were to be adjusted and in how to determine if respirators fit properly. A total penalty of $1400 was proposed for items 1a and 1b.

The judge found that, as to item 1a, the evidence conclusively establishes there were no frequent, random inspections conducted to determine if the respirators were properly cleaned, used, and maintained. As to item 1b, the judge found the evidence supports the charges made. He stated that the two fit tests specified by USS in its respirator program were neither effective nor appropriate for the Dustfoe 66 type of respirator supplied the employees by USS. He also stated that the evidence fails to reveal any opportunity afforded the workers to practice the fit tests under proper supervision, and that at least one employee had devised his own test. Finally, the judge modified the citation from repeated to serious and reduced the proposed penalty to $1000.

USS contends that insofar as item 1a relates to the usage of respirators, it is duplicative of item 1 in citation 3. Insofar as it is nonduplicative, USS argues the record does not support the judge's findings, but shows instead that its program for ensuring the maintenance and cleaning of respirators was adequate.

USS argues that no compliance officer testified to seeing any employee wearing a respirator which was improperly cleaned or maintained.

---

37/ (continued)

> seriously affect the fit of a facepiece. The worker's diligence in observing these factors shall be evaluated by periodic check. To assure proper protection, the facepiece fit shall be checked by the wearer each time he puts on the respirator. This may be done by following the manufacturer's facepiece fitting instructions.

USS states that the only evidence on the point was testimony by witnesses Siminitus, that no one ever checked his respirator, and Offenheiser, that supervisory employees were not taking action to see if respirators were cleaned and maintained. Siminitus' evidence is of questionable value, USS argues, because he never contended that he failed to regularly clean and maintain his respirator, and Offenheiser's testimony is directly contradicted by witness Yuhas. The latter testified, USS asserts, that he checked for defects in the respirators of his crew, and that he instructed certain employees about how to remove patching material stuck on respirators. Further, the Secretary's witness Lepionka testified USS's training program "did show to remove the rubber face piece and to wash it out with warm soapy water and to reassemble it."

With respect to item 1b, USS argues that the negative pressure and positive pressure fit tests contained in its training program and used with its Dustfoe 66 respirators complied with the requirements of the cited standard. USS states that witness Baumann, an industrial hygienist with 38 years of experience, testified that even though there were better tests available for use with the Dustfoe respirators, USS's tests had been recommended by the manufacturer of the respirators and were adequate. USS also argues that the standard as construed by the Secretary would permit the use of only two specified fit tests on the Dustfoe respirators, yet nowhere does the standard contain such a restriction.

The Secretary argues that, with respect to item 1a, the testimony of USS foreman Yuhas establishes USS had no systematic inspection program, and that all Yuhas did was to require employees to fix or replace

respirators with obvious defects. The Secretary also argues that proof any particular employees maintained their respirators properly does not establish the presence of a systematic inspection program required by the cited standard.

The Secretary also contends the judge properly affirmed subitem 1b and the judge properly credited witness O'Malley who testified that the fitting instructions given employees by USS were inappropriate. The Secretary also contends USS industrial hygienist Baumann admitted the negative pressure test recommended by USS was somewhat difficult for him to perform, and that the test would be even more difficult for an unsupervised employee to perform. Also, the Secretary argues that there is no evidence of adequate training, and that USS did not have an industrial hygienist capable of providing such training at Fairless.

The Commission is divided in its action on these items. Commissioner Cleary would affirm both item 1a and item 1b, while Chairman Rowland would vacate both items. With respect to item 1a, Commissioner Cleary points to the testimony of USS foreman Yuhas, who stated that it was part of his job to observe whether employees were wearing respirators and whether the straps of the respirators were in place. Yuhas testified that the problems he detected were all "visual problems, a broken strap or a missing clip. . . ." It was not his practice, however, to request an employee who was wearing a respirator to take it off so that he (Yuhas) could examine it. Yuhas also testified that he never went into the men's locker room to examine the condition of the respirators. Yuhas further testified that he never examined any of the respirators to see if all their parts were properly in place. Finally,

employee Siminitus testified that management personnel never checked his respirator to see that it was properly used, cleaned or maintained. Commissioner Cleary finds, therefore, that USS did not have the systematic program of inspection required by the cited standard to assure that employee respirators were properly selected, used, cleaned, and maintained. As mentioned above, Commissioner Cleary also finds that subitem 1a of citation 4 is not duplicative of subitem 1c of citation 3. The Secretary proved noncompliance with the citation 3 subitem by showing that employees worked in visible emissions without respirators; the Secretary proved noncompliance with the citation 4 subitem by showing the inadequacy of USS's respirator inspection program.

Chairman Rowland would vacate item 1a. He observes that the cited standard is not specific as to the frequency of inspections, the percentage of employees who must be inspected, and the scope of the required inspection. As USS correctly observes, there is no evidence that any employee's respirator ever was dirty, defective, or improperly used. Therefore, Chairman Rowland finds that the testimony by foreman Yuhas is sufficient to demonstrate that respirators were inspected for proper use, cleanliness, and maintenance. Yuhas testified that he would see each employee at least once during each shift and, based on a visual inspection of each employee, Yuhas would be able to tell if the straps of a respirator were tight and if the filter was secure. Yuhas also instructed employees regarding the use of cleaning fluid to clean respirators whenever he observed an employee wiping a dirty respirator with a paper towel. Chairman Rowland further observes that the employees who testified to the contrary, Siminitus and Offenheiser, have been discredited by the judge.

With respect to item item 1b of citation 4, Commissioner Cleary, who would affirm the item, observes that not only was there no adequately trained industrial hygienist at Fairless to give instructions on fit and to check employees for properly fitted respirators, but supervisory personnel who were responsible for inspecting respirators, like Yuhas, did nothing more than check respirators for readily observable defects.

Commissioner Cleary does not base his finding of noncompliance on the alleged inadequacy of the fit tests suggested for use by USS with its Dustfoe 66 respirators. Those fit tests were undisputedly recommended by the manufacturer of the respirators, and he does not interpret the cited standard to require USS to reevaluate the manufacturer's recommendations. In fact, he observes that the last sentence in cited section 1910.134(e)(5)(i) provides that "the manufacturer's facepiece fitting instructions" may be followed to check proper fit.

Chairman Rowland would vacate item 1b. He points out that the cited standard requires respirator instructions be given by "competent persons," but does not define "competent persons." He also finds that no evidence was presented by the Secretary to show that an industrial hygienist or environmental engineer is required under the standard. The Chairman further finds that USS's safety slide program did in fact provide employees with the instruction required by the cited standard. USS's company-wide industrial hygienist, Baumann, whose competence was established, assisted in the development of that program and there is no evidence in the record to show that those administering the slide program at Fairless were not competent to read the instructions developed

by Baumann while the slides were being shown.[38/] Further, the Chairman does not agree that USS failed to comply with the cited standard by not evaluating or checking the adequacy of the fit of the respirators on each employee. He finds that this conclusion goes beyond the Secretary's allegation on this item.

Nonserious Citation 5, Item 1

The Secretary alleges noncompliance with the standard at section 1910.141(d)(2)(ii)[39/] in that USS failed to provide hot and cold or tepid running water for the lavatory on the east side of the coke battery. The Secretary does not propose a penalty.

The judge found the Secretary's allegations supported by the evidence. He referred first to an amended stipulation of the parties that the lavatory at the cited location had only cold water, and that its hot water pipe was not operative on the day it was inspected. The judge

---

38/ Chairman Rowland agrees with Commissioner Cleary that the instructions USS gave its employees on proper fit of the Dustfoe 66 respirators were in compliance with the terms of the standard, since those instructions were recommended by the manufacturer of the respirators.

39/ The standard at section 1910.141(d)(2)(ii) reads:

§ 1910.141 Sanitation.

* * *

(d) Washing facilities --

* * *

(2) Lavatories.

* * *

(ii) Each lavatory shall be provided with hot and cold running water, or tepid running water.

found that the water pipes servicing the lavatory frequently froze up during cold weather, stopping all the lavatory's water supply. He also found that, occasionally, the water pipes would be shut off purposely to prevent their freezing, and that this condition probably existed for over a year.

Although the Secretary did not propose any penalty, the judge assessed $250. The judge found that the nonfunctioning water pipes made cleaning respirators and washing before eating, as required by the standards cited for items 1b and 4 of citation 3, impossible or inconvenient and forced employees to go elsewhere to wash.

USS concedes that the lavatory's hot water pipe froze up frequently. It argues, however, that the evidence does not support a finding by the judge that the lavatory's water supply would be shut off deliberately to prevent freezing, and cites hearing testimony implying possible vandalism. USS argues for reversal of the judge's penalty assessment. It states that the employees did their washing in the lunchroom and cleaned their respirators in the shower room, and that, therefore, the lavatory's frozen pipes did not prevent employees from complying with the hygiene requirements of other standards.

We affirm item 1. The judge's ruling of noncompliance is supported by the amended stipulation referred to above. His finding that the water pipes were shut off to prevent freezing, however, is neither supported by the record nor necessary to the establishment of noncompliance with this standard, and therefore is rejected. Finally, we agree with the Secretary that the violation does not warrant the assessment of a penalty.

VI

Severity of the Violations and Propriety of the Penalty Assessments

A

The judge found that all the violations set forth in citations 1, 2, 3, and 4, as modified by him, are properly denominated as serious because of the cancer and other health risks inherent in coke oven emissions. He found citation 5 was properly denominated as nonserious. In conjunction with his penalty assessments, the judge addressed each of the four penalty factors enumerated in section 17(j) of the Act.[40/] With respect to size, he stated that USS is the nation's largest steel producer, with approximately 167,000 employees and 1976 gross sales of about nine billion dollars. He also stated that USS is a large, if not the largest, coke oven operator in the country.

The judge found that the gravity of the violations was high. He relied on the preamble to the coke oven standard to conclude that overexposure to coke oven emissions results in an increased risk of cancer to the genito-urinary and pulmonary systems, skin cancer, and other harmful pulmonary conditions. He found the Fairless employees had been exposed to "massive and continuous" coke oven emissions for at least a

---

40/ Section 17(j) of the Act, 29 U.S.C. § 666(i), provides:

Sec. 17. PENALTIES

* * *

(j) The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

year after USS's own engineers had recommended the rebuilding of the Fairless batteries. He added that the "emissions were so massive that visibility atop the batteries, at times, was so reduced that the workers could not see."

With respect to good faith, the judge found that Fairless's management had shown a "striking" lack of good faith, and that there was "interminable" delay and "resistance" in complying with the 1977 standard. He found that USS's Clairton facility had implemented stage charging in 1973, that mechanized gooseneck cleaners had been in use at other USS plants for years but had not been installed at Fairless, that air-conditioned booths and standby pulpits had been installed at other USS plants but not at Fairless, and that years had gone by before Fairless detected that subcontractor work done on its aspiration system was faulty. The judge found that Fairless's failure to rebuild its batteries for over a year after its engineers had recommended rebuilding meant that oven doors, jambs, and frames became so badly deteriorated that it was impossible to produce adequate spare doors or to make many of the existing doors seal properly. The judge further found that USS's corrective action program of patching the ovens to keep them going was carried out by a totally inadequate number of employees and was a "desperate effort to get more coke from the ovens -- regardless of the amount of coke oven emissions caused by the holes, cracks, broken frames, and smoking and burning doors and frames."

Also on the question of whether USS exhibited good faith, the judge stated that USS failed to enforce the use of respirators, and that USS dispensed Dustfoe respirators without providing its employees with

adequate use instructions. He cited as an example of bad faith the opening paragraphs of USS's training program:

> You are here to be informed about a new federal law. . . This law was imposed by the Occupational Safety and Health Administration upon all people who work in coke plants throughout the United States.
>
> They say there is an increased risk of acquiring cancer for those who are exposed to coke emissions, and this is an attempt to reduce this risk.

The judge stated that the quoted paragraph had "obvious" implications, and that the result was "a lack of conviction by the employees that real hazards exist at the coke ovens. . ." Finally, the judge stated that USS's lack of concern for the health of its employees was expressed by USS's failure to warn them of the dangers inherent in laundering their work clothes.

With respect to history, the judge concluded that USS had "a rather poor record. One hundred four citable conditions (not counting the violations in this case — approximately 40), found in five years, can not realistically or reasonably be labeled 'excellent,'" as USS claims.

B

USS argues that citations 1, 2, 3 and 4 should be designated non-serious. It calls the Commission's attention to Usery v. Hermitage Concrete Pipe Co., 584 F.2d 127 (6th Cir. 1978), a case dealing with employee exposure to excessive levels of silica dust. USS alleges the court there rejected the Secretary's argument that to prove a serious violation he need only show that silica existed in excess of the TLV, that employees had been exposed to silica, and that exposure to silica can cause death or serious physical harm. Rather, USS asserts, the court

said the issue is whether the degree of exposure experienced by employees in the particular plant could result in silicosis.

Applying the court's test to this case, USS argues that the Secretary presented no evidence with respect to the length of time USS's employees had been exposed to any specific amount of CTPV. Further, the Secretary presented no evidence as to what amount of CTPV one must be exposed to — and for what period of time such exposure must last — for it to be concluded there is a substantial probability that death or serious physical harm could result from such exposure. USS also contends that its employees were only exposed to excessive amounts of coke oven emissions temporarily, that the violative conditions were corrected long before the hearing, and that the period of temporary overexposure did not cause "any real cancer threat."

USS contends that the judge erred in upholding the Secretary's penalty proposals. It reasserts that the gravity of the alleged violations is not high because there is no evidence that any particular violation had the possibility of causing exposed employees to get cancer. With respect to past history, USS alleges that its Fairless Works had been inspected 33 times between mid-1973 and mid-1977 and that as a result of all those inspections, the Secretary only alleged 104 violations of the Act. The Secretary had alleged only eighteen serious violations and eighty-six nonserious violations, USS asserts. Further, USS states, penalties had only been proposed for eighteen of the nonserious allegations, with the highest penalty being $130. USS argues that this past history constitutes an excellent record, and that the judge's finding its history was "poor" should be reversed.

USS argues it acted in good faith because of the actions it took to abate conditions giving rise to the citations. Those actions include: 1) the call in its compliance program for implementation of all engineering controls required by the standard except mechanized standpipe cleaners, which USS considers infeasible, 2) the use of chuck door gaskets to replace the luting of chuck doors, 3) the termination of the practice of shoveling coal back into the ovens and the installation of chutes on the pusher side door machines to funnel coal directly into the ovens, 4) the installation of a new door rebuild facility, 5) goosenecks and standpipes being cleaned more frequently, 6) the September 20, 1977 revision in its training program to include all required practices, and 7) written warnings issued to employees not using their respirators.

USS states it disagrees with the judge's finding that USS's "interminable" delays in complying with the new standard demonstrate its lack of good faith. Although the judge downgraded its good faith because other USS plants had implemented stage charging before Fairless, USS points out that it has seven plants with coke batteries and that not everything could be done everywhere concurrently. USS also states that even though the judge sought to create the impression that Fairless was always the last USS plant to acquire controls required by the standard, such was not the case. Fairless was not the last plant to get either stage charging or air filtration units, and Fairless was one of five other plants that had not obtained mechanized gooseneck cleaners. It also reasserts that its delays in rehabilitating the coke oven battery were caused by its inability to obtain bricks and by its need to have an energy source to operate the plant in the cold winter of 1977-1978.

With respect to respirators, USS argues that it could hardly have been in bad faith by virtue of its having instructed employees to use a fit test recommended by the manufacturer of the respirators and that it had made efforts to get employees to wear respirators but that resistance was widespread, as exemplified by the testimony of Siminitus who stated, "If I can get away with it, I won't wear it [his respirator]." In spite of employee recalcitrance, USS argues, it had been effective in getting 50 per cent of the employees to wear respirators when required.

USS adds that the laundering of employees' work clothes was done by the families of employees for only the brief January 20 - April 4, 1977 period before plans for the commercial laundering of those clothes had been implemented, and that its training program statement about the coke oven standard being "imposed" on employees was accurate and not indicative of bad faith.

The Secretary relies on the judge's discussion of the penalties' appropriateness. The Secretary argues that lower penalties would be inappropriate in light of USS's size and the gravity of the violations.

The Union argues that the judge's penalty assessments are proper. It states that the test for whether a particular violation is serious is set forth in California Stevedore & Ballast Co. v. OSHRC, 517 F.2d 986, 988 (9th Cir. 1975):

> Where violation of a regulation renders an accident resulting in death or serious physical injury possible, however, even if not probable, Congress could not have intended to encourage employers to guess at the probability of an accident in deciding whether to obey the regulation. When human life or limb is at stake, any violation of a regulation is "serious."

The Union argues that the Hermitage case, supra, does not support USS's argument that citations 1-4 should be designated nonserious. The

Union reads Hermitage as holding that the decision whether a violation is serious is within the Commission's discretion under the substantial evidence test. The Union also argues that the record in this case does contain evidence on the questions raised in Hermitage about proof of the length of employee exposure to a harmful substance and about proof of the duration of employee exposure needed to create the possibility of death or serious harm. On the former question, the Union contends, employee exposure commenced when the batteries started operations in 1952 and 1953 and continued through the date of inspection. On the latter question, the Union contends that there is really no safe exposure limit for a carcinogen, but that the Secretary has established 150 $ug/m^3$ as the feasible CTPV limit to which employees can be exposed without suffering material impairment of health. The Union states that the exposure limit was arrived at under the section 6(b) standard-setting procedure of the Act, as discussed in the coke oven emission standard's preamble, and that USS's breach of that limit constitutes a per se serious violation.

The Union then seeks to refute USS's argument that the respirator penalties should be reduced because of employee resistance to wearing respirators. The Union states that 75 per cent of the employees wore respirators, and that USS's claim of employee resistance to respirators is not supported by the record. The Union asserts that USS has failed to deal fairly with the employees on the matter of respirators, and that the reason supervisors gave employees for wanting them to wear respirators was that the government was "getting on their [USS's] tails."

C

The Commission is divided in its characterization of citations 1-4. Commissioner Cleary concludes that the citations are properly characterized as serious. Commissioner Cleary notes that the violations contained in these citations resulted in the overexposure of USS's employees to carcinogenic coke oven emissions and therefore to the possibility of life-threatening cancer, the disease which the coke oven emissions standard was primarily promulgated to protect employees against. Commissioner Cleary also finds that the condition of the coke ovens was poor during the period of inspection, that the condition had been poor over an extended period of time — so poor that employees had sometimes to work in areas of visible coke even emissions — and that USS knew about the poor condition of the ovens for an extended period of time. Commissioner Cleary further finds that the Secretary has proven the exposures existing during the inspection, stipulated by the parties to be in excess of 150 $ug/m^3$, were representative of typical exposures experienced by the employees. See Hermitage Concrete Pipe Co., 82 OSAHRC , 10 BNA OSHC 1517, 1982 CCH OSHD ¶ 25,975 (No. 4678, 1982). Consequently, because the carcinogenic nature of the coke oven emissions threatened employees with the possibility of contracting cancer and because the exposures in excess of 150 $ug/m^3$ existing during the inspection were proven to be representative of the exposures suffered by employees over the extended past, Commissioner Cleary would find that these violations are serious in nature. See Anaconda Aluminum Co., 81 OSAHRC 27/A2, 9 BNA OSHC 1460, 1477, 1981 CCH OSHD ¶ 25,300 at p. 31,349 (No. 13102, 1981); Hermitage Concrete Pipe Co., supra.

Chairman Rowland would find the violations in citations 1-4 to be nonserious. He does not agree with the presumption stated in Anaconda Aluminum Co., supra, that any overexposure to a carcinogen which is life-threatening is serious in nature. Instead, the Chairman would require the Secretary in all instances to demonstrate under section 17(k)[41/] of the Act that a substantial probability exists that a life-threatening disease could result from the exposure of the employees in question. The Chairman notes that the preamble to the coke oven standard specifically states that duration of exposure is a significant factor in determining the risk that an employee will contact cancer. 41 Fed. Reg. at 46745-46. The record in this case shows only that employees were exposed to coke even emissions in excess of 150 $ug/m^3$ at the time of the inspection. There is no evidence concerning the duration of employee exposure to coke oven emissions in excess of the limit provided in the standard. There is also no evidence regarding the amount or duration of exposure to coke oven emissions that would render substantially probable the contraction of cancer. Thus, the Chairman would

---

41/ Section 17(k) of the Act, 29 U.S.C. § 666(j), provides:

Sec. 17. PENALTIES

* * *

For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

conclude that none of the violations were shown to be serious in nature. The Chairman would also observe incidentally that citation 4 was affirmed as a serious violation by the judge even though the citation issued by the Secretary was designated repeated, not serious. On its face, this result appears contrary to Toler Excavating Co., 75 OSAHRC 76/C8, 3 BNA OSHC 1420, 1975-76 CCH OSHD ¶ 19,875 (No. 2637, 1975).

In setting the penalties, we have not relied on the judge's finding that USS acted in bad faith and that its prior history was poor. Instead, we believe that USS's good faith and history are neither remarkably good nor bad. USS faced obvious problems in complying with all of the detailed requirements of the 1977 standard at an old facility. As we have noted, immediate compliance with many of the requirements would not have been feasible and was not required. In general, the steps USS took toward compliance, while certainly not "heroic," did demonstrate a certain amount of diligence. The penalty assessments are therefore based primarily on the gravity of the violations and on the large size of USS. For violations of lesser gravity, such as that involving the failure to assure that employees wash their hands and face before eating, we assess lesser penalties.

VII

Was USS Accorded a Fair Hearing?

USS argues that the "hostility and prejudice" of the judge deprived it of a fair hearing. It contends that the hearing resembled "a grand inquisition in which the . . . Judge assumed the role of Torquemada," and that the judge's decision is based on "twisted logic, strained interpretations of the law, distortion of evidence, and general capricious and arbitrary disregard of the facts." It states that the judge's

cross-examination of its witness Seidenberger goes on for thirty pages in the transcript and was conducted in a heavy-handed manner. USS contends that the judge asked USS witnesses 1045 questions during the four days in which they testified and claims that the judge asked its witnesses and counsel questions about their personal beliefs on certain matters in the hope of using the information to justify his decision.

USS argues that the judge's questioning reveals a "sarcastic hatred and contempt for large corporations" and illustrates with the following remark made by the judge while asking about USS's corporate hierarchy: "To what corporate officer do you believe that Mr. Smith reports to, or does he report right to God?" USS also argues that the judge identified himself with the Secretary and the Union by making complimentary statements about the Union's attorney. USS states that one of the most glaring examples of the judge's prejudice is revealed in the disparate treatment he accorded to witnesses Offenheiser and Siminitus, who testified for the Secretary, and witness Seidenberger, who testified for USS. Although the judge finds that Offenheiser and Siminitus gave contradictory testimony, USS states, the judge tended to excuse them for doing so because they were upset about USS's lack of concern for employee safety. When Seidenberger gave what the judge considered to be "evasive and nonresponsive answers," however, USS states that the judge exhaustively grilled him on cross-examination.

Although the Secretary does not brief the fair hearing issue, the Union argues that Commission procedural rule 66(j), 29 C.F.R. § 2200.66(j), authorizes the judge to "[c]all and examine witnesses and to introduce into the record documentary or other evidence" and that rule

66(f) allows the judge to regulate the course of the hearing. In a complex case like this one, the Union continues, the judge's questions were needed for the preparation of a clear, complete record. With respect to the judge's questioning of USS's witnesses about their "personal beliefs," the Union contends that it was important to certain issues in the case, like good faith, for the judge to learn how USS personnel viewed the coke oven problem. The Union also states that judges are allowed to have their own opinions, citing United States v. Morgan, 313 U.S. 409, 421 (1941).

USS's contention that it did not receive a fair hearing is rejected. We have reviewed the entire transcript and conclude that the judge did accord USS a fair hearing. Although some of the statements made by Judge Brennan deserve to be characterized as intemperate and devoid of judicial decorum, we find that the judge did not prejudge any specific issue in this case but did rely on the proofs presented at the hearing to resolve the disputed issues for him. See United States v. Morgan, supra; United Steelworkers of America v. Marshall, 647 F.2d 1189 (D.C. Cir. 1980).

The transcript reveals that Judge Brennan was almost invariably courteous to all those who participated in the case's nine-day evidentiary hearing. His questioning of witnesses and attorneys was, in the vast majority of instances, designed to elicit necessary material that the attorneys had not obtained, give him a better understanding of the coke manufacturing process, and assemble a more complete record in this complex case. Also, although the judge did compliment the Union's attorney, we view the compliment as a tribute to the attorney's competence rather than an illustration of the judge's predisposition for her side

of the case. Further, the judge's allegedly disparate treatment of the Secretary's witnesses Offenheiser and Siminitus as opposed to USS's witness Seidenberger does not bear out a charge of prejudice. The judge acknowledged that Offenheiser and Siminitus made some contradictory statements and downgraded their credibility somewhat as a result. The fact that the judge might have spent more time cross-examining Seidenberger than Offenheiser or Siminitus does not sustain USS's prejudice allegation.

As mentioned above, however, the judge did make certain ill-considered remarks. Such remarks have no place in our proceedings and we admonish Judge Brennan to comport himself in a manner more compatible with his judicial office.

VIII

Where the Commission members are divided on the disposition of an item, they agree to affirm the judge's disposition of that item. See Marshall v. Sun Petroleum Products Co., 622 F.2d 1176 (3d Cir. 1980), cert. denied, 449 U.S. 1061 (1982). The following items are affirmed and penalties assessed:

| | | |
|---|---|---|
| Citation 1, item 6; Citation 2, item 7 | — | $ 600 |
| Citation 1, item 7; Citation 2, item 8 | — | $ 600 |
| Citation 1, item 8; Citation 2, item 9 | — | $1000 |
| Citation 1, item 9; Citation 2, item 10 | — | $ 600 |
| Citation 1, item 10; Citation 2, item 12 | — | $1000 |
| Citation 2, item 11 | — | $1000 |
| Citation 3, items 1a, 1b, 1c(a and b) | — | $ 500 |
| Citation 3, item 2a | — | $ 250 |
| Citation 3, item 4 | — | $ 150 |
| Citation 3, item 5 | — | $ 150 |
| Citation 4, items 1a and 1b | — | $1000 |

The Commission also affirms item 1 of other than serious citation 5, but does not assess any penalty. The total of the penalties assessed in the decision is $6,850.

The following citation items are hereby vacated:

Citation 1, items 1, 2, 3, 4, 5, 11, 12, 13;
Citation 2, items 1, 2, 3, 4, 5, 6, 13a, 13b, 14, 15;
Citation 3, items 1c(c), 2b, 3, 6b, 6c.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.

STATEMENT OF THE CASE

This expedited case arises under the provisions of Section 10(c)[1] of the Occupational Safety and Health Act of 1970 (the Act),[2] and involves the "new" Coke Oven Emissions Standard.[3] There are involved five Citations, Serious Citation No. 1 - 13 numbered Items; Serious Citation No. 2 - 15 numbered Items; Serious Citation No. 3 - six numbered Items;[4] Repeat Citation No. 4 - one numbered Item and Nonserious Citation No. 5 - four numbered Items, only Item No. 1 of which was contested (R.p. 3), issued pursuant to Section 9(a) of the Act[5] by the Secretary of Labor through the Area Director of the Occupational Safety and Health Administration (OSHA) for Philadelphia, Pennsylvania (Complainant), to United States Steel Corporation at its Fairless Hills, Pennsylvania steel plant (Respondent). Penalties totalling $35,700 were proposed by Complainant pursuant to Section 10(a) of the Act.[6] Neither Items 2, 3 or 4 of Nonserious Citation No. 5 nor the $100 proposed penalty for each of these three Items were contested, and consequently, these Items and the penalties proposed thereon have become a final Order of the Review Commission by operation of Section 10(a) of the Act. Consequently, only proposed penalties totalling $35,400 are at issue herein.

---

1/ 29 U.S.C. 659(c).

2/ 29 U.S.C. 651 et seq.

3/ See "Background" infra.

4/ At the close of the receipt of evidence, Respondent's Motion to withdraw its Notice of Contest to Items 4 and 5, as to the violation only but not as to the penalty, was granted. Tr. 1649.

5/ 29 U.S.C. 658(a).

6/ 29 U.S.C. 659(a).

On March 17, 1976, OSHA received an employee complaint requesting an inspection of Respondent's coke oven batteries. On March 22, 1977, an OSHA inspection party, divided into a number of teams including five field Industrial Hygienists, arrived at Respondent's Fairless Hills coke oven facility, to determine compliance, or a lack thereof, with the "new" Coke Oven Emissions Standard, 41 F.R. 46784-46790, Oct. 22, 1976; 29 C.F.R. 1910.1029.

The on-site inspection, begun on March 22, 1977, was substantially completed on April 4, 1977. On September 12, 1977, a closing conference was held with Respondent's representatives, followed on September 14, 1977 with the issuance of the five Citations at issue herein.

By letter dated October 20, 1977, United Steelworkers of America - AFL-CIO and Local 4889 (the Union) elected party status (R.p. 5). After the filing of a Complaint (R.p. 7) and Answer thereto (R.p. 8), Respondent's Motion for An Indefinite Postponement of the hearing, pending a decision by the Third Circuit Court of Appeals in its review of the "new" Coke Oven Emissions Standard, (AISI et al. case infra), (R.p. 8) was denied by written Order dated January 23, 1978 (R.p. J-3). The Union's Motion for an Expedited Proceeding, dated January 27, 1978, (R.p. J-4) was granted by the Review Commission by Order dated February 9, 1978 (R.p. J-5).

Thereafter pretrial discovery was conducted, and two prehearing conferences were held, the first on February 21, 1978, the second on May 1, 1978, during which numerous Motions for Summary Judgement were denied. The parties entered into a lengthy (66 pages with attachments) Joint Stipulation of Facts (Stipulation), which is attached hereto and specifically incorporated herein as Appendix A.

Pursuant to the agreement of the parties, trial began on May 15, 1978, and continued for eight additional work days, finally terminating on May 26, 1978, producing a transcript of 1789 pages. All parties were ably represented by counsel.

All post trial briefs, from the three parties, were received by July 10, 1978.

## BACKGROUND

The following information may assist in an understanding of this case.

### The "New" Coke Oven Emissions Standard

29 C.F.R. 1910.1029

The first "Coke Oven Standard" was promulgated by the Secretary of Labor (Secretary) in 1969, under the Walsh-Healy Act, 41 U.S.C. 35-45, adopting a 1967 recommendation of the American Conference of Governmental Industrial Hygienists. (34 F.R. 788-796). In 1971, this Standard was adopted as an "established Federal standard" under Section 6(a) of the Act, 29 U.S.C. 655(a) (36 F.R. 10466, 15101, 1971).

In June of 1971, the American Iron and Steel Institute (AISI), in which United States Steel Corporation is a member, petitioned the Secretary of Labor for a standard specifically for coke ovens, followed a month later by a petition from the United Steelworkers of America for a more stringent standard - a major point of difference relating to proposed safe exposure limits of coal tar pitch volatives (the emissions created by the coking process). In September, 1971, the Secretary denied both petitions and requested the National Institute of Occupational Safety and Health (NIOSH) to expedite research relating to employee exposure to coke oven emissions.

In February of 1973, NIOSH issued its report, "Criteria for a Recommended Standard - Occupational Exposure to Coke Oven Emissions." This report recommended, in part, the use of specified engineering controls and operating procedures, supplemented by respiratory protection.

In August of 1974, the Secretary empanelled a Standards Advisory Committee on Coke Oven Emissions to review the NIOSH report and to make recommendations for a new Coke Oven Emissions Standard. After lengthy hearings, on-site inspections and review of documents, the Committee submitted its report (3,500 pages in length) to the Secretary on May 24, 1975.

On July 31, 1975, the Secretary published his Proposed Standard for Coke Oven Emissions in the Federal Register. From November 4, 1975 to January 8, 1976, and from May 4, to May 14, 1976, hearings were held on the proposed Standard, all pursuant to the provisions of Section 6(b) of the Act, 29 U.S.C. 655(b).

On October 19, 1976, the Secretary published the new Coke Oven Emissions Standard, to become effective on January 20, 1977 (41 F.R. 46742-46790).

In December, 1976, AISI and others applied to the Secretary for a stay of the effective date of this Standard, which was denied in January, 1977. The United States Court of Appeals for the Third Circuit was then petitioned for a stay of the Standard by AISI and other members of the steel industry, including Respondent herein. On February 18, 1977, the Third Circuit Court vacated an interim stay which it had granted a month earlier, and reviewed the new Standard, as petitioned, under the provisions of Section 6(f) of the Act, 29 U.S.C. 655(f).

On March 28, 1978, the Circuit Court affirmed the new Coke Oven Standard, except for three particulars not relevant here. This Judgment was amended in a particular not relevant here on May 1, 1978 (R.p. J-41).

> American Iron and Steel Institute, et al. v. OSHA et al., ____F.2d____ (3rd Cir., 1978) (Nos. 76-2358 et al., March 28, 1978), as amended by Order dated May 1, 1978; (AISI case). See Slip Opinion at record page J-21 (Vol. II) of this Docket file.

Coke and Coke Ovens

Coke is a porous, cellular by-product of the destructive distillation or carbonization of coal. It is used primarily by the steel producing industry as a fuel in its blast furnaces and foundries.

A coke oven battery is a large, generally rectangular structure, typically 200 or more feet long, 40 to 60 feet wide, and up to 50 feet in height. The battery is divided by refractory brick walls into a series of narrow ovens or coking chambers, about 18 inches wide and from 13 to 20 feet high extending the full width of the battery, separated from the adjoining oven by a heating chamber. Heating and oven chambers alternate with each other so that there is a heating chamber on either side of an oven. This heating process causes the carbonization of the coal within the ovens, and results in the production of coke and various distillates.

Each oven has three or four "charging" holes in its roof through which the coal is inserted into the oven. Each oven has a large door at each end. At the end of the coking cycle, both doors are removed and the incandescent coke is "pushed" out of the oven (from the "push" side, out the "coke" side) into a "quench" car, taken to a quench tower, cooled with water and stored until used.

The coking process produces a substantial amount of gases and other distillates. These are captured, part of the gases being used as fuel for the coke ovens, the remainder for various coke by-products. These gases are removed from the ovens by one or two vertical pipes, called standpipes or ascension pipes, through horizontal pipes called goosenecks, to one or two collector "mains" (large, horizontal ducts).

Coke production consists of three basic operations: "charging," "coking," and "pushing."

The "charging" cycle begins by loading the individual oven, with coal, to a predetermined level (the coal level), to allow free space above the coal so that the gases may be moved from the oven and collected. This "charging" procedure is done with the use of a large, mechanical "larry car" which operates on rails on the top of the battery. The larry car receives a premeasured load of coal, into its three or four hoppers from a coal bunker located at the end of the battery. The number of hoppers correspond to the number of charging holes in the ovens. The loaded larry car moves away from the coal bunker and is positioned over the oven to be charged. The charge hole lids are removed and the larry car hoppers are emptied into the oven. After the coal is in the oven, a small door at the top of the pusher door, called a "chuck" door, is opened and a leveler ram, or arm, part of the equipment on the pusher door car, is mechanically inserted into the oven to level the coal within to the predetermined "coal line." During this charging process, the oven is placed under steam "aspiration" (forced or induced draft) by the use of steam jets located in the standpipes. This aspiration system is designed to induce a draft within the oven to increase the exhausting effect and thus reduce or limit the escape of gases from the oven into the ambient air

during the charging process and is called "charging on the main." After the charging is completed, the charging lids and chuck doors are closed, the aspiration shut off and the "coking" operation begins.

There are a number of variables which determine the desired "coking" time, such as width of the oven, its condition, coal moisture and nature of the coal used, and this time varies from about 16 to 20 hours, averaging about 17 or 18 hours. Coking time is selected so that the coke adjacent to the oven walls has a temperature from 1900° F to 2000° F. The heating chamber temperatures range from about 2600° F to 2800° F.

When the coal is coked all the way through, the doors on each end of the oven are removed by large, mechanical door machines, which run on rails at the "bench level" of the battery. With both doors removed, a large, mechanically operated ram, mounted on a pusher car, pushes the coke out the coke side of the oven, through the coke guide into a large quench car or hot car. The hot car then moves on rails to the quench tower where the coke is cooled with water and then dumped onto the coke wharf. When the oven doors are put back onto the oven, the procedure begins all over again. (See preamble to "new" Coke Oven Emissions Standard, 41 F.R. 46742-46744).

## Coke Oven Emissions

A major hazard to coke oven employees is the risk of certain types of cancer and other diseases caused by exposure to coke oven emissions, the violatile gas by-products, created by the coking procedure. This is succinctly stated in the preamble to the Standard as follows:

III. Coke Oven Emissions-Exposure Hazards

The overwhelming scientific evidence in the record supports the finding that coke oven emissions are carcinogenic. This finding rests on epidemiological surveys as well as animal studies and chemical analyses of coke oven emissions. As discussed more fully below, coke oven workers have an increased risk of developing cancer of the lung and urinary tract. In addition observations of animals and of human populations have shown that skin tumors can be induced by the products of coal combustion and distillation. Finally, chemical analyses of coke oven emissions reveal the presence of a large number of scientifically recognized carcinogens as well as several agents known to enhance the effect of chemical carcinogens especially on the respiratory tract.

In addition, recent updates of the major epidemiological study of coke oven workers show an elevated risk of nonmalignant respiratory diseases such as bronchitis or emphysema.

41 F.R. 46744

* * *

In conclusion, there is an overall excess mortality rate for cancer of the genito-urinary system for coke oven workers that is statistically significant at the one percent level... .

41 F.R. 46747

* * *

H. Conclusion. The evidence in the record conclusively supports the finding that coke oven emissions play a causal role in the induction of cancer of the lung and genito-urinary tract in the exposed population. Constituents of coke oven emissions and coal tar, a by-product of the coking process, are known animal skin carcinogens and have been related to increased skin cancer mortality in human populations similar to coke oven workers. This information is sufficient to warrant protective measures designed to reduce employee exposure to coke oven emissions.

41 F.R. 46748 [7]

---

[7] For a detailed review of the evidence underlying these conclusions, see the preamble to the Standard at the cited pages.

Coke oven emissions can leak out of the coke ovens at any unsealed point, such as charging holes, doors, door frames, standpipes and goose-necks, and are emitted whenever the gas-tight integrity of the oven is broken deliberately, during the charging and pushing procedures. Of course, emissions are given off into the ambient air during the coke push and while in the quench car prior to being cooled.

Because of the hazards inherent in coke oven operations (supra), employee exposure to coke oven emissions has been limited since at least 1969 (when the Secretary adopted a 1967 recommendation of the American Conference of Governmental Industrial Hygienists) to 0.2 $mg/m^3$ for an eight hour day.[8/]

As finally promulgated, the "new" Coke Oven Standard set a "permissible exposure limit" (PEL) to the benzene-soluble fraction of total particulate matter of .15 $mg/m^3$,[9/] averaged over any eight hour period. It further established "Regulated areas," with access limited to authorized persons.

In order to attain the new "permissible exposure limit," an extensive list of engineering and work practice controls are mandated in the new Standard, to be implemented (as far as existing coke oven batteries are concerned), "... at the earliest possible time, but not later than January 20, 1980 ... ." 29 C.F.R. 1910.1029(f)(1)(i)(a), 41 F.R. 46785.

---

8/ Two-tenths of a milligram of coal tar pitch volatiles per cubic meter of air, the so-called Threshold Limit Value (TLV).

9/ Translated as 150 micrograms per cubic meter of air, or 150 $\mu g/m^3$.

Because of the length (16 pages with its attachments) and amount of detail set forth therein, and in order not to unduly enlarge this decision, this "new" Coke Oven Standard is attached hereto and the relevant Sections are specifically incorporated herein, as Appendix B.

Its general design is as follows:

29 C.F.R. 1910.1029

(a) Scope and application.

(b) Definitions.

(c) Permissible exposure limit - to coke oven emissions not to exceed 150 micrograms per cubic meter of air averaged over any eight-hour period.

(d) Regulated areas - essentially the coke oven battery, its topside, pushside and coke side and attendant machinery, the battery ends, the wharf and screening station.

(e) Exposure monitoring and measurement. Employers are directed to monitor coke oven employees in regulated areas to determine exposure to coke oven emissions. Employees are to be notified of the results.

(f) Methods of compliance.

The employer shall control employee exposure to coke oven emissions by the use of engineering controls, work practices and respiratory protection as follows:

(1) Priority of compliance methods.

(i) Existing coke oven batteries.

(ii) New or rehabilitated coke oven batteries.

(f) Engineering controls.

Specific engineering controls are mandated covering the:

(i) Charging of coke ovens - including "stage charging" and the necessary controls to accomplish this type of charging, such as:

(b) Drafting from two or more points in the oven

(c) Adequate aspiration systems

(d) Mechanical volumetric controls on larry cars

(e) Devices to accomplish a rapid charge

(f) Individually operated larry car drop sleeves

(g) Mechanized gooseneck and standpipe cleaners; and others not relevant herein.

(ii) Coking phase - In order to control emissions during this phase, certain controls are mandated, such as:

(c) An adequate number of spare doors

(d) Chuck door gaskets; as relevant herein.

(f)(3) Work practice controls.

(i) For charging.

(a) Detailed, written work practices are specified covering, inspection, cleaning and prompt and effective repair of all engineering controls - covering goosenecks, standpipes, oven roof carbon build-up, aspiration system, standpipe caps and charging holes and their lids.

(b) Specific charging procedures are mandated.

(1) How larry cars are to be filled with coal.

(2) Aligning larry car over charge holes with use of drop sleeves.

(3) Seven specified charging procedures.

(ii) For coking - detailed procedures during coking cycle.

(iii) For Pushing - detailed procedures during push cycle.

(iv) Maintenance and repair - detailed written maintenance and repair procedures, with repairs "completed as soon as possible".

(f)(4) Filtered Air.

Employers are to provide positive pressure, temperature controlled, filtered air for the larry cars, pusher machine, door machine, and quench cars with similar type standby pulpits on the battery topside, wharf and screening station.

(f) (6) Compliance program.

Employers are directed to "establish and implement a written program to reduce exposures solely by means of the engineering and work practice controls..." required under the Standard, with specified minimal provisions.

(f) (7) Training in compliance procedures.

All written procedures and schedules mandated under Section (f) of the Standard (engineering and work practice) must be included in a training program required under Section (k) of the Standard.

(g) Respiratory protection.

(1) Provision for providing of and use.

(2) Cleaning and replacement of.

(i) Hygiene facilities and practices.

(1) Change rooms

(2) Showers.

(3) Lunchrooms - must be temperature controlled, positive pressure with filtered air.

(4) Lavatories.

(5) Prohibition of activities in the regulated areas - no eating, drinking (except water) or smoking.

(j) Medical surveillance - periodic medical examinations with results thereof to specified persons including the employee.

(k) Employee information and training - training program for employees to be instituted and given at specified times covering procedures mandated under the Standard.

(l) Precautionary signs and labels.

(m) Record keeping.

(n) Observation of monitoring by employees or their representatives.

(o) Effective date - January 20, 1977.

The Fairless Hills Coke Ovens

At Fairless Hills, Pennsylvania, Respondent maintains a steel manufacturing facility which includes two coke oven batteries, No. 1 and No. 2. Both batteries were built in 1952 of the Wilputte design, Battery No. 1 going into service in 1952 and Battery No. 2 in 1953. Each battery consists of 87 coke ovens, each oven having the following dimensions: 12 feet 2 inches high, 40 feet 7-5/8 inches long and 18 inches wide. Approximately 16 tons of coal are charged into each oven to a calculated coal line of 11 feet 2 inches. The coke was heated to an average temperature of 2000° F and the average coking time was 16-1/2 hours at the time of the OSHA inspection.

These ovens are operated 24 hours a day, seven days a week and are maned by three eight hour shifts (called "turns") of coke oven employees, the "day turn," and two "back turns." Eighty-one ovens were normally pushed each turn at the time of the inspection.

The following is a description of Fairless battery equipment:

1. Both batteries have double collector mains, each oven having three charging holes.

2. The larry car for Battery No. 1 is a turntable design built by Wilputte in 1952. Between August 23, 1976 and October 18, 1976, this

larry car was modified to include: 1) New drop sleeves, 2) New volumetric controls and 3) a new drive in the central turntable.

3. The larry car for Battery No. 2 is a turntable design built by Wilputte in 1952.

Both larry cars have three hoppers each of which are filled with coal from a coal bunker located between the two batteries.

4. The pusher machine for both batteries were each built in 1952 by Wilputte.

5. The pusher and coke side door machines for both batteries were all built in 1952, by Wilputte (each battery has one push side and one coke side door machine), as was the quench car which services both batteries.

There were no significant modifications to the equipment listed in subparagraphs three through five, supra between 1952 and the time of the inspection. (Stipulation, pp. 4-7).

The Citations at issue are discussed next. Due to the number of Items as well as cited Sections of the Standard, neither the "Description" of the alleged violations as they appear in the Citations, nor the cited Sections of the Standard are quoted verbatim. However, each "Description" is quoted in the Stipulation (Appendix A, attached) and the cited Sections of the Standard are readily available in the copy of the Standard attached as Appendix B.

Serious Citation No. 1 deals with Respondent's Coke Oven Battery No. 1, whereas Serious Citation No. 2 pertains to Battery No. 2. The contested Items will be dealt with seriatim and, where possible, Items from both Serious Citations No. 1 and No. 2 will be coupled when each deals with a common factual situation.

## THE CITATIONS

### SERIOUS CITATION NO. 1 - ITEM NO. 1

### SERIOUS CITATION NO. 2 - ITEM NO. 1

These Items charge that specified employees, on both Batteries were exposed to concentrations of coke oven emissions in excess of the PEL of 150 micrograms per cubic meter of air for an average eight-hour period, prohibited by Section .1029(c) of the Standard.

The Stipluation at pages 8, 8a, 27 and 27a, the only evidence introduced as to these Items, establish these violations as alleged.

### SERIOUS CITATION NO. 1 - ITEM NO. 2

### SERIOUS CITATION NO. 2 - ITEM NO. 2

These Items charge that Respondent had neither equipped nor operated either Battery No. 1 or No. 2 with stage charging - one engineering control method mandated by Section .1029(f)(2)(i)(a) of the Standard.

The stipulated facts establish among other things, that stage charging was considered by Respondent as applicable to both batteries, and that it was not being performed at either location during the inspection. (See Stipulation, pp. 9, 10, 28, 29).

One major defense of Respondent to these Items, as well as the other Items involving failure to implement the engineering and work practice controls mandated in Sections .1029(f)(2), (f)(3) and (f)(4) of the Standard, is that under Section .1029(f)(1)(i) of the Standard which sets forth the priority of compliance, it legally has until January 20, 1980, to have these controls in place at Fairless.

Complainant's position is that Respondent, under Section .1029 (f)(1)(i) must implement these controls "at the earliest possible time,"

and under the facts of this case, "the earliest possible time" had expired as of the March-April, 1977 OSHA inspection, and thus the absence of the cited engineering and work practice controls, constitute violations of the Standard.

Respondent argues that such a construction of the Standard, nullifies the "January 20, 1978" time limit, and is improper.

However, Respondent's argument, if followed, would nullify the "at the earliest possible time" requirement for implementing controls.

Thus, there is presented, in effect, a quasi-legislative or administrative policy question, best determined by the Secretary, who is charged with enforcing the provisions of the Act. As long as his determination is reasonable and carries forward the objectives of the Act, it receives great deference by the Courts. (See "Respondent's Defenses" section, infra, and Brennan, Secretary of Labor v. Southern Contractors Service et al., 492 F.2d 498, 501 (5th Cir., 1974)).

It is concluded that the requirement to implement the mandated engineering and work practice controls "at the earliest possible time," because of the grave health conditions attempted to be dealt with by these requirements, is a reasonable exercise of the Secretary's discretion. When "the earliest possible time" occurs, as to any coke oven operation, must be determined on a case by case basis, upon the evidence of record.

## GENERAL HISTORY OF STAGE CHARGING

In 1973, a private research concern, the Battelle Columbus Laboratories, conducted a second research project of coke oven emissions, (the first was done by them in 1970), under the sponsorship of the AISI, which produced

a "Summary Report on Control of Coke Oven Emissions," dated December 31, 1973. (Parts of this report were admitted as Exhibit C-1 herein).

Personal observation and evaluation visits were made by Battelle personnel to 32 coke oven plants in the United States, Canada, Japan, West Germany, the Netherlands and Great Britain. As stated in this Report,

* * *

> In general, Battelle found the state of the art to be greatly advanced since Battelle's previous study prepared in 1970. Techniques available as of 1973 are capable of doing an excellent job of reducing or preventing the former massive emissions of the process.
>
> (Exhibit C-2, p. 1)

In the section of this Report dealing with charging coke ovens, the following observation is made:

> . . . it is Battelle's position that the 1973 state of the art is best represented by an operating technique [stage charging] that was fully disclosed (and thoroughly ignored) in 1961[10/] (bracketed material supplied).
>
> (Exhibit C-1, p. 13)

After a thorough explanation of the stage charging techniques and equipment modifications necessary to effect this method, the Report states:

> The British operations were not seen to make any smoke, at all, during observation periods in three plants. The American operations were subject to occasional small wisps of smoke.

---

10/ This reference is explained at p. 30 of this Report as follows:

> In adopting staged charging as the generic term for this report, we apologize to the British operators who created both the technique itself and the terminology herewith abandoned. Let it suffice that good, effective, adequate smokeless charging was practiced and reported in the English Midlands fully 12 years ago, and universally ignored by others until recently on the grounds that it was "only a variation" of charging on the main.

> Overall, every staged or sequential charge observed in every plant under every condition was clearly superior to every other charge observed during the course of this study. Furthermore, in our opinion, the conditions of observation did not permit 'rigging' of a good show at any point; we believe we saw matters as they are, day in and day out. Finally, staged and sequential charging operations were in every instance apparently within the reasonable expectations of reasonable regulations.
>
> Battelle's evaluation is, therefore, that staged charging, in its many variations, is a superb approach to the control of charging emissions, short of sealing of the process. It can be recommended unequivocally as an approach to solving charging problems at most conventional coke plants. (Underling in original).
>
> (Exhibit C-1, p. 33)

Thus, historically, stage charging has been reported in the coke oven literature, and successfully practiced since 1961. Its advisability as a combination of engineering controls, (i.e., equipment modifications such as drop sleeves and volumetric controls on the larry cars, and adequate steam aspiration pipes and nozzles) and work practice controls, (i.e., control or sequence of charging, maintenance of clean standpipes and goosenecks) was recommended to the U. S. coke oven industry, via the first Battelle report in 1970 - as a result of their first study sponsored by AISI, and "recommended unequivocally" in its second report in 1973.

HISTORY OF STAGE CHARGING BY U. S. STEEL CORPORATION

United States Steel, initially investigated stage charging beginning in July, 1972, at its Fairfield, Alabama Coke Works, which resulted in the "successful application" of this technique at both its Fairfield Works and its coke facilities at Clairton, Pennsylvania, in 1973.

In a paper entitled "Stage Charging on a Single Collector Main Battery: A Total System Concept," presented by a Mr. Frank Clark of United States

Steel's Fairfield Works at a "1973 Ironmaking Conference," there is a rather extensive discussion of this charging technique. The following excerpts are relevant herein:

> Stage charging is the ordered pouring of coal into the oven so that a space for gas exit is consistently maintained regardless of coal flow. Emissions are effectively contained in the ovens and collecting mains by steam aspiration and then exhausted through the regular gas handling equipment. Stage charging requires the design of larry car hoppers, such that each will contain a measured portion of the total coal volume required to charge an oven. The hoppers are then discharged into the oven in an ordered sequence so that an open tunnelhead, or gas exit, is maintained at the top of the oven until the last hopper is discharged, thereby insuring that the resultant blockage is always in the same location prior to leveling. Stage charging as described was used first on double collector main batteries. Fairfield Works has adapted this method to single collector main batteries.
>
> A Total Systems Approach
>
> In order to achieve optimum smokeless charges using the stage charging methods, Fairfield has used a total systems approach. The following system components were identified and developed:
>
> 1. A free space for gas exit to the collector main must exist on either side of the charging hole containing the coal for leveling.
>
> 2. Coal level and peak height must be controlled to maintain the gas exits.
>
> 3. There must be sufficient steam aspiration to evacuate the gases.
>
> 4. There must be a continuing program of cleaning and maintenance.
>
> 5. Proper operating practices must be adhered to consistently.
>
> Conclusion
>
> In conclusion, stage charging has been operational on Batteries 5 and 6 since March, 1973. The overall operating schedule has not been affected, and larry

maintenance problems have decreased. This system is now in operation on a total of five batteries at Fairfield and offers a practical means of controlling charging emissions. Batteries 5 and 6 were chosen by EPA as a basis for its recommended new source standards. (First, second and next to last unnumbered pages, Exhibit C-1)

Exhibit C-1, a United States Steel document, thus establishes that stage charging, was in fact, successfully practiced at two of Respondent's coke oven locations, Clairton and Fairfield, not later than March, 1973.

Further significant insight concerning research and development of stage charging, done by U. S. Steel, is set forth in Exhibit C-3, a paper presented at the annual meeting of the Air Pollution Control Association at Denver, Colorado, on June 12, 1974, by members of U. S. Steel's Clairton Works, and Pittsburgh headquarters offices. The following excerpts are relevant:

"CHARGING EMISSION CONTROL BY USE OF STAGE CHARGING"

There is general agreement among the operators of the conventional slot type by-product recovery coke ovens that the major source of emissions occurs during the charging of coal into the oven at the beginning of the coking cycle. This paper describes the work that has been done at the Clairton Works of United States Steel Corporation to effectively reduce charging emissions.

Clairton Works is located fifteen (15) miles south of Pittsburgh, Pennsylvania, on the banks of the Monongahela River. It is listed as the world's largest coke plant, charging about 30,000 net ton of coal per day, and has highly advanced facilities for coke oven gas processing and coal chemical refining equipment. Coke making operations were begun at the plant in 1916 and expanded over the next 30 years. In 1946 a complete rebuilding program for all its coke ovens was undertaken. This was completed in the late 1950's. The coke ovens incorporated well-established designs, and all were equipped with double collector mains and steam aspiration for on-the-main charging.

* * *

In 1969 an intensified research and development program was undertaken jointly by Clairton Works and the USS Research Laboratory, aimed at finding reliable methods to effectively control charging emissions which could be adapted without major alterations to the existing coke ovens. It was recognized that in addition to controlling charging emissions, the effects on coal carry-over into the collector mains, on tar quality, on excess air infiltration into the gas system, on lengthening of the machinery cycle, and loss of control of the oven coal line, would have to be taken into account.

Investigation and analysis of the configuration of facilities and practices then current, plus a careful review of the work that had been done by others, led to the conclusion that charging emission control could best be achieved by containing the emissions in the ovens and exhausting them through the regular gas handling system. To accomplish this would require more effective aspiration and a constantly unrestricted tunnel head in the oven (the space between the top of the coal charge and the oven roof) during the charging cycle. To maintain an open tunnel head it was recognized that control of coal flow from the charging hoppers on the larry car into the ovens would be required. These principles were not new. Coke plant operators had experimented previously with various types of so-called 'sequential charging,' as we had done at Clairton in the 1960's. For example, Meades and Randell described their work based on these principles in an article in the June, 1961, issue of THE GAS WORLD entitled, 'Smokeless Charging.'

However, the objective of the investigational program at Clairton was to develop a specific charging system that would work effectively and reliably under the conditions existing at that location. This has now been accomplished and the system has been designated as 'stage charging.'

* * *

The first problem was to obtain adequate aspiration during charging. Initial studies of Clairton aspiration systems showed that they were not capable of aspirating all of the gases generated during charging. Standpipe and gooseneck size and configuration, type of damper valve, size of oven, plus other factors, all had to be taken into consideration in establishing the aspiration needed to control emissions effectively. Similar work in this area had been done under AISI sponsorship at J & L's Pittsburgh Works.[1] The techniques developed in that program were adapted and modified for use in conducting test programs at Clairton.

* * *

To obtain this gas flow it was necessary not only to increase the size of the steam aspirating nozzles, but also the nozzle pressure which, in turn, required new and larger steam supply headers. As mentioned above, these parameters are dependent on the standpipe-gooseneck configuration and the size of the oven. Furthermore, it is essential that the aspirators be kept clean to be effective, and this requires a regular well-supervised cleaning program. The importance of clean goosenecks and standpipes cannot be overemphasized.

* * *

These improvements in the steam aspiration system resulted in appreciable reduction of charging emissions, however, it was apparent that even with double collector mains, adequate steam aspiration and optimum conventional charging practices, consistent 'smokeless' charging could not be realized with gravity-feed larry cars, because of frequent tunnel-head blockage brought about by erratic flow of coal from the hoppers.

As a matter of interest, extensive tests were made using 'sequential charging.' By installation of a time relay system on the larry car, the control of the discharge of the coal was taken out of the hands of the larry car operator.

* * *

As a result of these tests, the conclusion was reached that absolute control of coal volume in each hopper, and a pouring practice that minimized the effect of variable rate of coal flow on the distribution of coal in the oven, were mandatory for a smokeless charging system.

Based on extensive tests conducted on a scale model of the charging system, it was learned that coal from the No. 1 and No. 4 hoppers could be dropped simultaneously into the oven with little or no interaction. After these hoppers emptied, No. 3 hopper was dumped, and when empty, was followed by No. 2 hopper. Thus, a coal hang-up or rate of flow from the hopper would not affect distribution in the oven. Since the hoppers were of essentially equal capacity, the test work made it apparent that the amount of coal put into each of the four would have to be changed considerably for stage charging. To do this, a procedure was developed for measuring the actual angle of repose of coal after it was

dropped into the operating ovens. This information was then used to calculate the coal volume to be placed in each of the hoppers.

The next step was to translate this information into actual practice on the battery. Two major alterations were required to the gravity feed larry. First, the volumetrics were modified to permit the outside hoppers (No. 1 and 4) to hold approximately 67% of the coal charge, with No. 3 hopper to contain 13% and No. 2 hopper, 20%.

* * *

The second change was to develop and provide a full apron with the easily adjustable volumetric to control the angle of repose of the coal in the hopper as it is loaded from the bunker (Photo II). This permits control of volume fluctuations due to changes in flow characteristics. A series of tests were conducted with coal blends in which moisture, size, and bulk density were varied, and it was determined that the angle of repose never exceeds 45°, therefore, the aprons are set at this angle. The aprons extend from the base of the individual stationary sleeve to the perimeter of the hoppers. Coal from the bunker will always flow outward to meet and be contained by the apron. Deviations such as partial restriction of the bunker gate opening by the larry car operator can also affect this volume control system, therefore, it was necessary for the bunker gate opening to be automatically controlled.

A specially designed smoke box was developed for the leveler bar to insure a nearly perfect seal over the chuck door opening. This maximized aspiration during the leveling operation (Photo III). These were the basic component changes for the charging system which, at Clairton, is called 'stage charging.'

The steps of the stage charging operation are as follows:

Step 1. After loading at the bunker the larry car travels to the oven. The operator performs the required offtake cleaning, and waits for the pusher operator to pour the charge. Upon receiving the signal which indicates that the pusher is

in position to level, the larry car operator lowers the drop sleeves over the open charging holes. The lidman turns steam into the goosenecks, places the oven on the main, being sure that the standpipe caps are seated properly, and signals the larry car operator when this step is completed (Illustration I).

It is extremely important that the drop sleeves totally enclose the charging holes and that the standpipe caps are sealed securely in order to reduce the possibility of pulling air into the aspiration system. This would effectively increase the total volume of gas beyond the capabilities of the system and force the excess volume into the atmosphere.

Step 2. To attain smokeless charges it is necessary to provide at all times during the charging cycle, a route for the gas to escape from the oven through the offtakes; thus the pouring procedure is of prime importance.

* * *

Step 4. No. 2 hopper is now discharged. After the No. 2 hopper has stopped running, and with sufficent coal remaining to assure a level charge, the signal is given to begin the leveling operation (Illustration IV). It is critical to the success of the operation that the chuck door remain closed until this time because premature opening or cracking will adversely affect the aspirating system.

A significant procedural step which must be emphasized is the prompt and complete replacement of the Nos. 4, 1, and 3 lids as each hopper empties. This action directs the full aspiration to the center of the oven where it is most needed. If careless or tardy lid replacement practices exist, the air above the charging holes is drawn into the gas offtakes at the expense of gas from the center of the oven; consequently, this gas will seek a vent into the atmosphere. These lids must be replaced before the leveling operation begins.

* * *

> The stage charging system is now in full operation on all batteries at Clairton. To date there have been no serious problems resulting from the practice in either the gas or the tar systems, and the lengthening of the machine cycle for charging has been accomplished without affecting over-all (sic) operating schedules.
>
> In conclusion, U. S. Steel's efforts to develop a practice to eliminate charging emissions at Clairton have resulted in the development of technology which, if matched to the basic oven characteristics, will control charge emissions effectively. The techniques are basic but require knowledge of the characteristics of the coal used, adequate and properly maintained aspirating systems including clean offtake piping, control of coal volume in the individual hoppers, and last, and probably most important, adherence by the operating crew to specific charging and leveling practices. If all these practices are followed, stage charging will achieve charging of coal into the oven without emissions to the atmosphere.

(Exhibit C-3, dated June 12, 1974)

(1) "Control of Coke Oven Emissions" by T. E. Dancy, presented at the 78th General Meeting of the AISI, May 27, 1970.

Exhibit C-3 thus reflects the extensive research, engineering and actual conversion work done at U. S. Steel's Clairton Works, beginning in the 1960's which resulted in successful stage charging in 1973, as reported in this paper in 1974.

STAGE CHARGING AT FAIRLESS WORKS

The documentary evidence of record further establishes that as early as October, 1971, the headquarters research organization of U. S. Steel, called the "USS Applied Research Laboratory" (ARL), conducted

a "preliminary" investigation of the steam aspiration system on the coke ovens at Fairless, to determine the aspirating capacity and any modifications to improve the capacity. The goosenecks at Fairless were equipped with "Corliss" dampers, essentially a damper utilizing a bowl with fluid as a seal, rather than a "Pullman" type damper, a slightly different configuration, used at U. S. Steel's Clairton and Fairfield Works. ARL's fear that the Corliss type damper might interfere with increased aspiration capacity proved groundless as desired aspiration was found capable of achievement, with the Corliss dampers, by increasing the steampipe and nozzle size and hence the rate of steam flow on the offtake system. (Exhibit C-4)

This increased aspiration capacity at Fairless, with the Corliss dampers in place, was actually accomplished within approximately 30 days, on four of the coke ovens by increasing steampipe and nozzle size and reported in the ARL Progress Report dated November 8, 1971. (Exhibit C-5)

This resulted not only in greatly improved emission control at the test ovens while charging ("low emission level") but additionally a recommendation from ARL that all Fairless aspiration systems be upgraded. Funds to accomplish this upgrading were "approved." Significantly, the success of this research project, establishing that significantly increased aspiration was attainable even with the Corliss dampers in place, reduced the anticipated cost of the aspiration upgrading from $450,000 (which included conversion from "Corliss" to "Pullman" dampers) to $100,000. (Exhibit C-6, dated November 29, 1971)

Thus, as early as November, 1971, all the necessary research and engineering to increase the aspiration systems at Fairless had been accomplished, larger steampipes and nozzles on four ovens actually installed and funds approved to upgrade the entire aspiration systems. Evidently, this upgrading was accomplished sometime in 1972. (Exhibit C-9, second paragraph).

In February, 1974, funds were included in the Fairless budget to implement stage charging at these two batteries. (Exhibit C-7, dated February 7, 1974). Consultation with various U. S. Steel personnel began on February 18, 1974. (Exhibit C-8, dated February 22, 1974, and Exhibit C-9, dated February 22, 1974).

In March, 1974, air flow measurements of the Fairless aspiration system were taken and the 1971 predicted capacities were found. However, it was determined that the existing steam "regulators" (one per battery) were too small and new regulators were ordered. (Exhibit C-10, dated March 15, 1974).

Also during this period, the angle of coal repose (which effects larry car hopper modifications) was determined, as well as a decision reached not to replace the Corliss values as it was not necessary to accomplish stage charging. (Exhibit C-11, dated March 22, 1974).

By March 29, 1974, the larry car hopper configuration and size had been determined. (Exhibit C-12, dated March 29, 1974).

These determinations were in part, slightly altered in April 1974, because of a coal spillage problem. (Exhibit C-14, dated April 5, 1974)

Recommendation for ". . . modifications to the larry cars, steam-aspiration facilities, and associated equipment (including new operating procedures) for the two coke batteries at Fairless Works", were finalized by June 12, 1974. (Exhibit C-15, dated June 12, 1974)

ARL design and research engineers met with Fairless engineers to review "preliminary drawings of the larry car modifications required for implementing stage charging," on September 10, 1974. (Exhibit C-16, dated September 13, 1974)

The new steam regulators for the aspiration systems had been installed, tested and found satisfactorily adequate by September 20, 1974. (Exhibit C-17, dated September 27, 1974)

From October 15 to 25, 1974, a detailed inspection of the two Fairless Coke Oven Batteries was done by two U. S. Steel engineers and a co-op student. They concluded that,

SUMMARY

> Both batteries were found to be in exceptionally good condition for 22 year old units. This is directly attributable to the stable operation and maintenance practices being utilized at Fairless Works. Oven doors are well maintained and kept clean and, except for a few minutes following a charge, door leakage is non-existent. Oven offtake and collecting mains are well maintained and overall battery emissions are being held at a very low level, with the exception of charging and pushing emissions.
>
> * * *
>
> The projected rehabilitation date (of both Fairless Batteries) is the first quarter of 1976. It is estimated that a rehabilitation in 1976 should result in extending the life of the battery ten years beyond the rehabilitation date. Operating practices that would help maintain the battery in good condition are recommended and discussed in more detail in the recommendation section of this report.

(Exhibit C-18, pp. 3,4, dated November 27, 1974)

These conclusory summary statements are subject to some significant questions, however, in light of detailed statements contained within the body of this report.

For example, refractory brick deterioration at certain locations had caused door jamb casting to "sag" or "drop". (p. 5) "The battery tops are heaved in line with the charging holes from north to south. Several buckstays[11] on both sides of each battery are distorted. ... All the jamb castings on the coke side of each battery are hourglassed. Some castings are hourglassed on the pusher side...." Sixteen jamb castings were found "broken." (p. 6) Forty-one doors (out of 174-87 ovens, 2 doors per oven) or 24% of all doors were identified as needing either repairs or replacement. (p. 7) Two standpipes on each battery were found to be leaking (p. 8) and 26 standpipe expansion joints were also found leaking (p. 9). One hundred thirty-two buckstays on Battery No. 1 and 132 on Battery No. 2 were listed as needing replacement (p. 13), with 131 jamb castings for each battery needing replacement (p. 14). All standpipes and their heat shields needed replacement and 25% (90) Corliss valves and goosenecks needed replacement. All other goosenecks and valves needed reconditioning (p. 15). One hundred percent of the charging hole castings and lids needed replacement (p. 15). One hundred percent of the larry car rails, door machine traction rails, quench car traction rails and 50% of the railroad ties needed replacement (p. 16).

---

11/ Buckstays are large, vertical steel beams, part of the support structure for the ovens.

At any rate, of greater significance herein, the report recommended modifying the larry cars by adding a second turntable motor for independent operation of the hoppers. It then stated;

> With this arrangement 'stage charging' can be accomplished to eliminate or reduce charging emissions.
> This modification should be initiated as soon as possible (p. 20).

A detailed work schedule was proposed to accomplish the recommended rehabilitation of the two Batteries, (with only a total loss of 10.8% of coke production), beginning in March, 1976, with completion in September, 1976 - a seven month period (pp. 21-25). (Exhibit C-18, dated November 27, 1974).

The foregoing exhibits,[12/] clearly establish that the Respondent herein, U. S. Steel, as early as sometime in the 1960's began experimenting with coke oven charging methods to reduce charging emissions at its Clairton Works. It "intensified" its research at this location in 1969. By March, 1973, stage charging had been fully developed and put into practice at both its Clairton and Fairfield Works.

U. S. Steel's central research group began studies at the Fairless Works as early as 1971 concerning the aspiration systems. By November of 1971, all the necessary research and engineering work on upgrading

---

12/ All U. S. Steel documents are non-hearsay, admissions against interest under Federal Rule of Evidence 801(d), and are thus substantive evidence. Exhibit C-2, the Battelle Report, is clearly admissible under Federal Rules of Evidence 803 (18-Learned treatises) and 803 (24). Because U. S. Steel, as the largest steel producer in the United States, is a member of AISI, the sponsoring organization for the Battelle Study and Report, Exhibit C-2 is probably admissible non-hearsay under Rule 801.

this aspiration system had been completed and the aspiration on four Fairless ovens actually upgraded. The entire aspiration system at Fairless was upgraded by some undisclosed date in 1972.

In February, 1974, funds were budgeted to implement stage charging at Fairless. By April, 1974, the configuration and size of the Fairless larry cars had been finalized. Final recommendation for stage charging at Fairless were made by June 12, 1974. Specific design work on the larry cars began, with ARL assistance, in September, 1974. The following month, November, 1974, as a result of the extensive in-house inspection of the Fairless Works by U. S. Steel engineers, final larry car modifications were spelled out and recommended to be accomplished ". . . as soon as possible." These engineers further recommended the reconditioning of both Fairless Batteries, which was scheduled for completion in September, 1976.

Thus, if the recommendations of its own engineers had been followed, Respondent could have fully implemented stage charging at Fairless by the end of the rehabilitation program for the two Fairless Batteries, September, 1976. It did not.

Complainant produced as its expert witness a Mr. Hopkins, a 1973 graduate of the University of Maryland with a Bachelor of Science Degree in Mechanical Engineering, currently employed with the U. S. Environmental Protection Agency (EPA), as an Environmental Engineer. After graduation, Mr. Hopkins was employed in the plant engineering construction department of Bethlehem Steel's Sparrow Point Steel Mill and participated in their management training program. At Bethlehem he was involved in designing the conversion of a larry car, control

devises for coke oven battery stacks and clean air rooms for coke oven workers. These activities occupied about 20% of his professional time. After two and a half years he went with EPA, where he has spent 90% of his time involved with coke ovens and coke oven control devises, keeping abreast of the state of the art of air pollution control devises available or used in industry, assisting EPA Regional Offices in enforcement cases and conducting research and studies of various control systems. He has made over ten visits to various coke oven installations in this country, including a two week observation of the coke oven door cleaning and other practices at U. S. Steel's Fairfield Works, and two, one week visits at U. S. Steel's Gary Works as the manager of the National Coke Battery Evaluation Program. In early May, 1977, in preparation for this case, he visited the coke oven batteries at the Fairless Works.

Mr. Hopkins, after describing stage charging and coke oven emissions (Exhibit C-28), relying both on his observations of the coke oven batteries at Fairless and on the documents produced by U. S. Steel, (Exhibits C-1 through 20) testified that stage charging technology was available within U. S. Steel by the early 1970's. Because U. S. Steel had implemented stage charging at two of its sites, Clairton and Fairfield, by early 1973, he opined that stage charging could have been achieved at Fairless by the beginning of 1974, which included an 18 to 20 month period to order or fabricate and install necessary equipment. (Not considering costs or production factors) (Tr. 354-470)

Thus, the evidence of this record establishes that stage charging could have been implemented at Fairless, at the earliest by 1974 (Mr. Hopkins), or at the latest, by September, 1976 (Respondent's own documents). When inspected by OSHA, in March-April, 1977, stage charging had not been implemented "at the earliest possible time."

It is therefore concluded that the evidence of record cited supra, establishes the violations set forth in Items No. 2 of Serious Citations No. 1 and No. 2.

SERIOUS CITATION NO. 1 - ITEM NO. 3

SERIOUS CITATION NO. 2 - ITEM NO. 3

These Items charge insufficient aspiration systems on both Fairless Batteries. As pointed out previously, one essential element of effective stage charging is an efficient aspiration system. The Standard at .1029 (f) (2) (i) (c) therefore mandates the design and operation of an aspiration system "... to provide sufficient negative pressure and flow volume to effectively move the gases evolved during charging into the collector mains, including sufficient steam pressure ...."

The Stipulation establishes the insufficient aspiration system on both Fairless Batteries. (Stipulation pp. 11, 12, 30)

Further, Respondent's own studies of the Fairless aspiration system, beginning in 1971 resulted in the upgrading of the system in 1972 (Exhibits C-5, C-6, C-9), with the Corliss dampers in place (Exhibit C-11).

It was not until October, 1976, when stage charging was attempted at Fairless, that it was detected that certain ovens did not have proper aspiration. The steam pressures varied on those ovens which emitted

emissions compared to those where there were no emissions. The steam pressure was not consistent for all ovens. Investigation revealed that in 1972, when the system had been upgraded (believed to have been done by an independent contractor), the work was improperly done on some branch lines - which restricted the steam pressure to the poorly - aspirated ovens. This situation was corrected during the 1977 repair of the batteries (after consultation with ARL and Clairton visiting teams). (Tr. 908-912)

The record is not clear why Fairless management did not detect the improperly performed work on some branch lines for four years. At any rate, it was management's responsibility to assure itself that the entire upgraded aspiration system was installed properly in 1972 and cannot now claim the misfeasance of the (unidentified) independent contractor as a justifiable reason for not having an adequate, properly functioning aspiration system in place and fully operable during the March-April, 1977 inspection.

Respondent defends against these Items, (as well as Items numbered 4, 5, and 6 of Citation No. 1, and Items numbered 5, 6, and 7 of Citation No. 2) on the grounds that these Items charge a failure to have implemented some (but not all) of the necessary procedures for stage charging. Since Items No. 2 in both Citations No. 1 and 2, charge the absence of stage charging on both Batteries, this is an improper method to manufacture additional violations, which are, in effect, all incorporated in the "no stage charging" violations in Item 2 of both Citations No. 1 and No. 2.

Respondent's argument is not pursuasive because, each failure to comply with each provision of the Standard, is a citable violation of the Act.

The violations, as alleged, are established.

SERIOUS CITATION NO. 2 - ITEM NO. 4

This Item charges that the larry car for Battery No. 2 was not equipped with individually operated drop sleeves - a necessary element of stage charging, mandated by Section .1029(f)(2)(i)(f) of the Standard.

The Stipulation establishes the lack of this equipment on larry car No. 2 and hence this violation, as alleged, is established. (Stipulation p. 31)

SERIOUS CITATION NO. 1 - ITEM NO. 4

SERIOUS CITATION NO. 2 - ITEM NO. 5

These Items charge that the goosenecks and standpipes on both batteries were not equipped and operated with "mechanized" cleaners, as mandated by Section .1029(f)(2)(i)(g) of the Standard.

A necessary part of stage charging is an offtake system, i.e. standpipes and goosenecks connecting the oven to the collector main, which provides an unobstructed passage for charging smoke and emissions to be drafted, or aspirated (exhausted) out of the oven into the collector mains, during charging.

The coking cycle produces a relatively light "fluff" carbon (easily cleaned) and/or hard carbons, on the underside of the oven roof, as well as within the standpipes and goosenecks. The type and amount of carbon so produced, varies depending on a number of factors, such as type of coal being coked, coal line levels, and the type of heating utilized in the ovens.

A number of methods have been used for many years in the coke industry to clean away these carbon deposits, i.e., decarbonizing.

First, for approximately the last hour of the coking cycle, (when most of the volatile matter has been coked off), and before the coke is pushed from the oven, lids on the standpipes are opened and the oven doors or charging hole lids are "cracked", i.e., slightly opened.

This "vents" the oven which allows the increased flow of ambient air to aid in burning away much of the accumulated carbon. Depending on the amount of carbon buildup, this "venting" process can take from 10 minutes to approximately 24 hours to effectively clean the standpipes. Thus, most coke oven operations routinely have two or three ovens, "venting" or decarbonizing at any given time.

Second, manual cleaning. After the coke is pushed, employees using long-handled scrapers, scrape the carbon from the interior of the standpipes and goosenecks gaining access thereto through the open standpipe lids. This procedure of course, requires the employees to be exposed to emissions emanating through the standpipe lids as they perform this cleaning process.

Another method practiced in both the United States and Japan is to equip the pusher ram with compressed air, thus interejecting oxygen and burning the carbon off the oven roofs. This method appears inappropriate for standpipe cleaning because the air nozzles would have to remain positioned below the standpipe which, because of the rate of burning, could or very possibly would, burn the refractory lining at this point in the oven roof as well as within the standpipe.

Pusher arms have also been equipped with serrated steel teeth which have been effective in cleaning hard carbon from oven roofs.

Two additional cleaning methods have been tried by U. S. Steel at various coke oven plants since 1970.

A ball and chain, mounted on the larry cars, is mechanically dropped down the standpipe for the purpose of knocking off hard carbon. It has proven not to be successful on any significant buildup of hard carbon as the ball merely bounces off the carbon. (It apparently is successful in removing "fluff" - i.e., light carbon).

One highly successful method of keeping standpipes clean of hard carbon buildup has been practiced at U. S. Steel's Provo, Utah coke ovens since 1942. It involves injecting steam into the standpipe at its base, thus aspirating the standpipe and burning the carbon from within the standpipe. When done with sufficient frequency - this method has been completely successful.

There was some question raised at the hearing herein as to whether this method would qualify as a "mechanized" standpipe cleaner.

Because of its efficiency, and because this devise does not require any employees near the standpipe when in operation - as is required for employees to manually clean the standpipes with scrapers, it is concluded that this system satisfies the requirements of the Standard and can be legitimately labeled one type of "mechanized" standpipe cleaner.

This effective system could have been installed at the Fairless batteries by equipping the standpipes with steam nozzles at their base.

However, because Respondent was justified in questioning whether the Secretary would accept this method of cleaning standpipes as a "mechanized" standpipe cleaner, the only effective method set forth in the evidence in this case, the absence of this system at Fairless was justified. Thus this portion of these two Items must be vacated.

"Mechanized" gooseneck cleaners, however, present a different picture.

A "Cooky Cutter" type of gooseneck cleaner (essentially a ram mounted on the larry car with a round disc which is inserted into the gooseneck to cut the accumulated carbon), was first used at U. S. Steel's Gary ovens in 1970. Additional "Cooky Cutters" were installed at Gary in 1975 and 1976. They appear to have been effective so long as the standpipes and goosenecks are in proper alignment. (These items go out of alignment because of the high thermal stress to which they are subjected). If carbon is allowed to build up the cutters appear not to be effective.

However, another type of gooseneck cleaner, in use at Fairfield since 1973, does appear to be effective, called a "Flail" type cleaner. This type consists of rotating knives which, when inserted into the gooseneck, are effective in cutting carbon away. Respondent's ovens at Gary and Clairton have been equipped with this "Flail" type of cleaner, and after initial adjustments were made, have been effective. (See testimony of Respondent's Chief Staff Engineer for coke ovens, Mr. Hill, who has been closely associated with U. S. Steel's coke oven operations at Provo, Utah and elsewhere for over 25 years, Tr. 974-1182).

The Stipulation establishes that no "mechanized" gooseneck cleaners were installed at the two batteries at Fairfield at the time of the inspection and concedes that the installation of them is "technically" feasible. (Stipulation, pp. 13, 32).

It is therefore concluded that this violation, as to mechanized gooseneck cleaners, is established by the evidence of record herein.

SERIOUS CITATION NO. 1 - ITEM NO. 5

SERIOUS CITATION NO. 2 - ITEM NO. 6

These Items, as to both batteries, charge that an adequate number of spare doors were not available for replacement purposes as mandated by Section .1029(f)(2)(ii)(c) of the Standard.

A major source of coke oven emissions, industry wide, have been the oven doors, both on the push side and coke side, during the coking cycle. (41 F.R. 4676)

These doors are large, steel devises, extending generally from the top to the bottom of the oven. They are removed and replaced by a door car, which runs on rails at the bench level of the ovens. A door consists of the outer steel shell to which is affixed large steel, adjustable, spring loaded latches which force the sealing edges of the door into mating sealing edges in the steel door frame or jamb. These sealing edges must be maintained in proper condition to effect the designed sealing of the door. For approximately one half hour after a door has been put into place, it will leak to some degree until the coking process produces tar or other products which assist in completing the seal. Thereafter, a door (and its jamb) in proper condition will not leak emissions. The interior of each door consists of a refractory plug. (See photos 19, 21, 35, 36, 38, 51, 55, 57, 58, 59, Exhibit C-26).

Both the doors and their frames, (which are large vertical steel griders, with refractory brick between frames), are subject to thermal

warping during the coke cycle and mechanical damage when the doors are removed to push the coke and replaced for the next coke cycle. Consequently, adequate door repair facilities and practices are essential to produce spare doors, which are to be used on any given oven to replace that oven's door during its repair.

The Stipulation establishes that the 87 ovens of Battery No. 1 were equipped with 174 doors (two per oven), and 28 of these doors were noted to be leaking emissions at the time of the inspection. Battery No. 2 was similarly equipped with 174 doors, 12 of which were noted to be leaking. (Stipulation, pp. 14, 33). All doors noted by the OSHA inspection team as leaking, had been in place more than one hour into the coking cycle; and a list thereof was supplied by the inspection team to Respondent. (See Exhibit C-2 attached to Stipulation). At the time of the inspection there were approximately 15 spare door frames available for both batteries.

There was one door repair facility available at the time of the inspection[13/] which was producing two reconditioned doors per week utilizing a door repair crew consisting of two millwrights and two patchers who worked on doors only during the day shift, five days a week. It took 16 hours to make a door frame into a spare door.

Door racks were located at both batteries, and although some doors were noted in these racks, these doors were awaiting reconditioning and were not available for use. Long experienced coke

---

13/ This old facility was admittedly inadequate. Thus a new, additional facility was under construction and placed into service during the rehabilitation of Battery No. 1, in the latter part of April, 1977.

oven employees, for over two years prior to the inspection, had been providing management with lists of leaking doors. Little effective action was taken to correct the leaking door problem - essentially because the batteries had deteriorated so badly - that a complete rebuild was the only solution and was long over due.

The door condition situation clearly shows what had happened at the Fairless Batteries.

As referred to earlier, U. S. Steel engineers conducted a detailed, in-house inspection of these Batteries in October, 1974, reporting their findings in November, 1974, in Exhibit C-18. As of the time of that inspection, it was patently clear that these Batteries, having been in constant operation for over 20 years (since 1952 or 1953) were in dire need of rebuilding, and this rebuilding was recommended to begin in March, 1976, to be completed by September, 1976. As this report notes, (p. 6), all the door jamb castings on the coke side of each battery were "hourglassed", i.e., bent out of true alignment by age and thermal stress. Some castings, i.e., door jambs were "hourglassed" on the pusher sides. Sixteen door jamb castings were found "broken." Thirteen door jamb castings were listed as needing replacement. Twenty-four precent of all oven doors needed either repairs or replacement. A number of door jamb castings were found to have "dropped" or "sagged" because of a loss of steel to brick bearing around the door jambs.

Thus, the oven door frames or jambs on both sides of both Batteries were found in 1974 by this U. S. Steel inspection, to be in a badly deteriorated condition. When the recommendation of the U. S. Steel

engineer-inspectors, to rebuild and repair both Batteries, (to be completed by September, 1976), was not followed, the deteriorated conditions worsened, so that by the time of the 1977 OSHA inspection, the Batteries were in a serious state of disrepair, dispite efforts to keep the batteries in operation by temporary patching and repair work (see Exhibits R-6, 7, 8, 14A and 14B).

Thus, as accurately described by the coke oven worker witnesses, and as the OSHA photographs depict (Exhibit C-26), the Batteries were "burning down" at the time of the OSHA inspection, three years after U. S. Steel's oven engineers recommended the rehabilitation of the Batteries. (This rehabilitation was begun in April, 1977, after the OSHA inspection).

The long experienced coke oven workers testified that in excess of 50% of the oven doors on both batteries needed replacement. This condition obviously was aggravated by the broken and badly mishapen door frames, which made a tight seal between a door and such a frame practically impossible. No doors had been replaced on Battery No. 1 for the two weeks prior to the inspection because of the impending rebuild of this Battery. At the time of the OSHA inspection, the need for rebuilt doors was so great that as soon as a door was repaired or rebuilt, it was immediately placed into service. For a period of from six months to two years before the OSHA inspection, there were never more than one or two rebuilt spare doors in the battery racks ready for use. These doors would be pressed into immediate service as soon as the ovens for which they had been designated were pushed and that ovens leaking doors removed. Forty-one leaking doors

were noted during the OSHA inspection. Thus, the one or two rebuilt or repaired spare doors being produced per week, was not an adequate number.

Therefore, these violations, as alleged, are established by the evidence of this record.

SERIOUS CITATION NO. 1 - ITEM NO. 6

SERIOUS CITATION NO. 2 - ITEM NO. 7

These Items charge, as to both Batteries, that chuck door gaskets, to control chuck door emissions until the leaking chuck door is repaired or replaced, were not in use, as mandated by Section .1029(f)(2)(ii)(d) of the Standard.

The Stipulation establishes that during the OSHA inspection, certain chuck doors were leaking on both batteries. Although Respondent's coke oven Compliance Program (mandated by Section .1029 (f)(6)) stated that chuck door gaskets were in service, they in fact were not. (Stipulation, pp. 15, 35)

These facts are not contested by Respondent. Rather it argues in its brief that in lieu of the chuck door gaskets, it was "experimenting" with luting the chuck doors to find a better method of controlling emissions, and that this experimentation was "required" under Section .1029(f)(i)(b) of the Standard.[14/]

There is no merit to Respondent's argument. First, luting is a well-known, very old process of applying a clay-like slurry to leaks to patch them. It is not an unknown or untried method of plugging

14/ This provision was found wanting by the Third Circuit Court of Appeals in the AISI et al. case, supra, and was vacated.

leaks and cracks - in fact - at Fairless the luting of leaking charging lids, standpipes, goosenecks and other leaks in its ovens was a standard operating procedure. Secondly, the requirement for coke oven operators to "research, develop and implement" new engineering or work practice controls, vested only "after implementing all controls required ..." in the Standard (Section .1029(f)(i)(h), second sentence). Thus, Respondent, even if it believed that the research provisions of the Standard might survive judicial review, (which did not) nevertheless did not follow the Standard. It merely stated on paper that it was using chuck door gaskets when in fact, it did not.

These violations as alleged, are established.

SERIOUS CITATION NO. 1 - ITEM NO. 7

SERIOUS CITATION NO. 2 - ITEM NO. 8

These Items allege, as to both batteries, that Respondent did not follow the mandated "work practice" of inspecting and cleaning goosenecks and standpipes prior to each charge to a specified minimum diameter sufficient to move evolved gases from the oven to the collector mains, in violation of Section .1029(f)(3)(i)(a)(2) of the Standard.

The Stipulation sets forth the following facts.

A. Standpipes on Coke Oven Battery #1

Battery No. 1

1. The inside diameter of a standpipe on Battery #1 is 13 inches.

2. The respondent has not specified a minimum diameter opening to be maintained for standpipes to effectively remove the gases from the ovens to the collector mains.

3. Respondent has not supplied employees with the necessary tools to measure the effectiveness of cleaning standpipes to a minimum diameter.

4. Respondent's Job Breakdown from LC-4 dated May 6, 1960 and revised February 14, 1977 states that prior to each charge, the larry car operator is to 'scrape or chop carbon, tar or other buildup from underside of standpipe cap' and to repeat that step on standpipes.

5. At the time of the OSHA inspection, employees were not cleaning each standpipe prior to each charge.

6. At the time of the inspection during each shift, approximately 40 ovens were charged. Each oven has two standpipes.

B. Goosenecks on Coke Oven Battery #1

1. The inside diameter of a gooseneck is 13 inches.

2. The respondent has not specified a minimum diameter opening to be maintained for goosenecks to effectively remove the gases from the ovens to the collector mains.

3. Respondent has not supplied employees with the necessary tools to measure the effectiveness of cleaning goosenecks to a minimum diameter.

4. Respondent's Job Breakdown from L-8 dated January 14, 1977 and revised February 14, 1977 for stage charging on ovens states that the lidman is to inspect goosenecks to insure they are clean.

5. At the time of the OSHA inspection, employees were not cleaning each gooseneck prior to each charge.

6. At the time of the inspection during each shift, approximately 40 ovens were charged. Each oven has two goosenecks.

(Stipulation, pp. 16, 17)

Battery No. 2

Essentially identical facts were Stipulated as to Battery No. 2 as are set out under Battery No. 1, supra.

(Stipulation, pp. 36, 37, 37A)

Under the "Timken" work schedule followed at Fairless, (four separate crews, A, B, C, and D each working one shift per day, five days a week, making one crew available for each of the three shifts, seven days a week), the scheduled responsibility of the larry car operators included inspecting and cleaning 44 standpipes and goosenecks during one week. This number constituted 1/4 of the total number of goosenecks and standpipes on each Battery (each of the 87 ovens per Battery was equipped with two standpipes and two goosenecks). Thus, even if the larry car operators were able to discharge their inspecting and cleaning responsibilities in addition to their larry car jobs, each of the 348 goosenecks and standpipes on both Batteries would be inspected and cleaned one time each week. With the coking cycle for each oven lasting about 16 hours, each oven would accomplish close to 10 coking cycles per week. Under the cited provision of the Standard, each standpipe and gooseneck should have been inspected prior to each of these 10 charges and cleaned whenever necessary to maintain an unobstructed passage for the evolved gases.

This obviously was not done and these violations, as alleged, are established.

SERIOUS CITATION NO. 1 - ITEM NO. 8

SERIOUS CITATION NO. 2 - ITEM NO. 9

These Items charge that Respondent did not follow the work practice, of operating its ovens pursuant to an inspection and corrective action program which would control door emissions (during the coke cycle) to the maximum extent possible, as mandated by Section .1029(f)(3)(ii)(d) of the Standard.

Exhibit C-2 attached to the Stipulation identifies some 40 doors on both batteries noted to be leaking emissions at the time of the OSHA inspection. This list was not intended by the OSHA inspection team to be all inclusive, but rather merely representative, documentary evidence of the excessive leaking door problem encountered during the inspection.

As noted earlier, due to the badly deteriorated conditon of both batteries, and particularly the broken, bent and "sagged" or "dropped" door frames, over 50% of all the oven doors on both Batteries were leaking emissions, a condition which existed for not less than one year prior to the inspection. (See Exhibit C-26, photos 15, 16, 18, 19, 21, 38, 41, 42, 51, 53, 55, 58, 59, 79 and 80).

Under these conditons, although Respondent did have a door inspection and repair program operating, it was totally inadequate to cope with the problem.

The evidence reveals that the adjustment of doors while in place, (one way of stopping a leak in a door and frame which is not out of alignment), was not routinely carried on, (in all probability because so many doors and frames were so seriously deteriorated that no amount of adjustment could have stopped the leaking). Some adjustments were attempted after employees complained of leakage,

but some of these attempts were halfhearted and not effective - only some, but not all, adjustment screws on a door would be adjusted. The cracked and broken door frames, evidently most acute on the coke side of Battery No. 1 were not repaired or replaced nor were those doors within those frames, but rather patching was attempted, which was far from an all-out effort. Two patchers each with a helper worked only five days a week, during one shift. The leaking was so extensive that the patchers could not keep up with the deteriorated conditions.

The evidence reveals that the reconditioning of both Batteries, was first scheduled by Fairless management for September of 1976, which was postponed reportedly because of an insufficient supply of new refractory brick, to January, 1977, which in turn was further postponed until April, 1977, reportedly because of a shortage of natural gas used to fire the ovens.[15/]

Thus, Respondent's door inspection and corrective action program to control door emissions, such as it was, was totally inadequate in light of the very poor condition of the door frames and jambs, and an admittedly inadequate door repair facility to cope with the conditions of the batteries.

The evidence establishes the violations as alleged.

---

15/ This information was supplied to this record by a coke oven employee called as Complainant's witness. Respondent supplied no detailed evidence on the postponements of the rehabilitation of its Batteries.

SERIOUS CITATION NO. 1 - ITEM NO. 9

SERIOUS CITATION NO. 2 - ITEM NO. 10

These Items charge that Respondent failed to institute the work practice on the push side of both Batteries, of not shoveling spilled coke back into the coke ovens, as mandated by Section .1029(f)(3)(iii)(a) of the Standard.

Coke spillage on the push side of the Fairless ovens is caused when the pusher ram is retracted after a push and some coke is brought out with the ram.[16/]

The evidence reveals that during the OSHA inspection, two identified employees (Galambos and Brogan), and others were observed shoveling spilled coke back into the ovens. (Exhibit C-26, photos B-9, B-10). Management instructions to its Fairless employees (the jamb cleaner and door machine operator) consistently changed - from - shovel the spilled coke (push side) back into the oven - to - shovel it onto the bench level or to the ground below.

Respondent's Safe Job Procedure for its door cleaner - push side, issued in January, 1977 - directed that spilled coke be shoveled back into the empty oven, directly contrary to the Standard's prohibition. (See Exhibit R-18, last page). Its Standard Operating Procedure #4 for its door machine operator - push side dated December 7, 1977 - gave the same instruction, eight months after the OSHA inspection herein. (See Exhibit R-13A).

16/ Spilled coke on the coke side of the Fairless ovens is not at issue here in that a spillage box is provided into which spilled coke is shoveled.

The evidence establishes the violations as alleged.

SERIOUS CITATION NO. 2 - ITEM 11

This Item charges Respondent with a failure, as to Battery No. 2, to regularly inspect and promptly repair cracks, misalignment or other defects in goosenecks, standpipes, standpipe caps, charging hole lids and castings, as required by Section .1029(f)(3)(ii)(a) of the Standard.

The evidence reveals that the standpipe, coke side on oven B-9 was misaligned as its brick base had disintegrated. This condition had developed over approximately six months and could have been corrected in about four hours by replacing the standpipe and its base. (See Exhibit C-26, photo 68). Further, the goosenecks, coke side on ovens B-8 and B-9 had holes in them which were emitting flames. This condition had existed for about one month and could have been corrected by replacing the goosenecks, about a five hour task. (See Exhibit C-26, photo 67). An emission leak was detected at the push side gooseneck on oven C-29 during this inspection and had been leaking in excess of four months. This could have been repaired in approximately four hours.

Due to Respondent's failure to promptly repair these leaking standpipes and goosenecks, the violation as alleged is established.

SERIOUS CITATION NO. 1 - ITEM NO. 10

SERIOUS CITATION NO. 2 - ITEM NO. 12

These Items allege that Respondent failed to regularly inspect and promptly implement necessary repairs of its dampers, aspiration systems, and collector mains, on both batteries, as a mandated maintenance and repair work practice of Section .1029(f)(3)(iv)(c) of the Standard.

The Stipulation sets forth the following facts.

At the time of the inspection, components of the collector mains, (the Corliss valves), were observed to be cracked and leaking coke oven emissions (oven B-7, push side). It takes three to four hours to replace a defective Corliss valve including setup and cleanup time. On December 7, 1977, Respondent revised its compliance program to incorporate procedure No. 1 which included maintenance and repair of Corliss valves. (Stipulation, pp. 20, 41)

The evidence establishes that on Battery No. 1, oven B-7, and on Battery No. 2, ovens C-9, C-1 and C-11, all had Corliss valves which had been leaking for a long enough period of time (not less than one month) to allow the build up of escaping tar on the outside of the Corliss damper housings. (See Exhibit C-26, photos 27, 63, 64, 65, 28, 47, 48, 73).

The Corliss valves are housed between the goosenecks and collector mains, as part of the damper system, and function to stop gases from the ovens from going into the collector mains.

For a considerable period of time prior to the inspection, (about one year) patching crews were assigned to patch leaking Corliss valves, rather than replacing the defective valves. These patches did not last beyond two shifts before burning out. This patching work was spotty however, because the patching crews spent the great majority of their time patching leaking door frames.

A more permanent type of repair was to weld the leaks, which took approximately one and a half hours to complete. Although some weld-patching was done, it was not the most frequent type of patching done.

The replacement of a Corliss valve could have been accomplished in about four hours. However, because of the impending rehabilitation program, replacement of valves, at the time of the OSHA inspection, was not taking place.

Thus, although Respondent did inspect and patch the leaking Corliss valves, these repairs were not effective for any length of time which resulted in emissions from these locations.

These Items also reflect the consequences of the badly deteriorated condition of the two Batteries. Rather than promptly implementing effective repairs to make all the Corliss valve housings emission tight or replace defective valves, Respondent was trying to patch these housings, as well as numerous other parts of the batteries, and the ovens were in such bad shape, it did not succeed in controlling the leaks.

Thus Respondent's repair program for its Corliss valves was not adequate because effective repairs were not promptly made. The violations as alleged are established by the evidence.

SERIOUS CITATION NO. 1 - ITEM NO. 11

SERIOUS CITATION NO. 2 - ITEM NO. 13

These Items charge that Battery No. 2 was not operated in accordance with a detailed, written procedure of maintenance and repair, nor were repairs promptly effected on either Battery No. 1 or No. 2 to prevent miscellaneous, fugitive topside emissions, as required under Sections .1029(f)(3)(iv)(e) and (f)(3)(iv)(1) of the Standard.

Complainant's theory as to these Items is that the Standard is silent as to coke oven emissions leaking from either door frames or standpipes. Where such leaks occur, due to ambient heat, these emissions will rise to the topside of the ovens, and may be properly labeled "miscellaneous fugitive topside emissions." In short, any coke oven emission, from a source not specifically covered by the Standard, becomes a "miscellaneous" emission and is covered by the cited Sections of the Standard.

Because of the grave hazard attempted to be dealt with under this Standard (increased risk of cancer and other physical disabilities), such a construction of the Standard is consistent with the objectives of the Act, is reasonable, and a proper exercise of the Secretary's administrative discretion.

The evidence establishes that a number of door frames were leaking emissions, the frames on ovens C-12, B-13 and B-12 are completely documented in this record (See Exhibit C-26, photos 42, 38, and 53). These leaks were caused by the warped or hourglassed condition of the frames, and had existed for periods of from three weeks to four months. Door frames could have been replaced within a period of four to five days.

The standpipe on oven A-5, coke side, Battery No. 1 was out of alignment. Its brick base was deteriorated and leaking emissions (See Exhibit C-26, photo 9). This condition had existed for not less than two weeks prior to the inspection and could have been repaired within a four hour period.

In December of 1977, Respondent revised its compliance program to include a topside maintenance and repair program. (Stipulation, pp. 21, 42)

As to Battery No. 2, the evidence reveals that the push side standpipe caps on ovens C-26, C-27, C-1, C-3 and C-5 were leaking emissions, at least one or more hours after charging. Photos 61 and 73 (Exhibit C-26) show leaking caps which had not been luted.

Respondent's own job procedure for its lidman, dated January 14, 1977, at step 10, directs the lidman to "Inspect pusher and coke side standpipe caps for emissions and lute as required." (Exhibit C-27). However, the luting of leaking standpipes had not been a standard practice prior to January, 1977, and although luting material had been supplied thereafter, no consistent, systemized luting practice had been instituted and followed (or properly supervised), at the time of the inspection.

Thus, Respondent had failed to enforce its own job procedure as of the time of the inspection, resulting in leaking standpipe caps.

Further, as to Battery No. 2, the door frame on oven B-26 was broken and leaking emissions, and had been broken for about six months. (See Exhibit C-26, photo 21). The coke side oven door frames on ovens B-14 and B-8 were broken and leaking emissions. (See Exhibit C-26, photos 16, 31).

Based upon this evidence of record, it is concluded that the violations as alleged are established.

SERIOUS CITATION NO. 1 - ITEM NO. 12

SERIOUS CITATION NO. 2 - ITEM NO. 14

These Items charge that positive pressure, temperature controlled, filtered air cabs were not provided for the following equipment:

a) Quench car (one serving both batteries)

b) Pusher machines (one for each battery)

c) Larry cars (one for each battery)

d) Push side door machines (one for each battery)

e) Coke side door machines (one for each battery)

as mandated by Section .1029(f)(4)(i) of the Standard.

The Stipulation establishes that although it is technically feasible to install positive pressure, temperature controlled, air filtered cabs on all the machines cited, none of the machinery was so equipped during the inspection. Further, that Respondent's "Compliance Program" scheduled the installation of such cabs on the cited machinery at various times from the third quarter of 1978 to the fourth quarter of 1979. (Stipulation, pp. 32-36, 59-61)

The evidence is uncontroverted that the use of positive pressure, temperature controlled filtered air cabs or booths, to isolate employees from either air contaminants or excessive noise, is a basic and recognized industrial hygiene and facilitates engineering technique which has been successfully utilized to reduce employee exposure to air contaminants or excessive noise for a number of years.

What is involved here is designing and fabricating booths, which, because they are intended to be used on top or alongside of coke ovens (which operate at high temperatures), are capable of being

effectively air conditioned, (or heated in the winter time), with filtered air and positive pressure so that if the booths leak (or doors are opened so that employees can perform work tasks), the controlled environment within the cab does not become permeated with ambient, coke oven emissions.

The engineering principles and techniques, of air conditioning and heating, filtering air, and sealing a cab or booth, are well-known principles and techniques, generally commerically available in the United States for not less than 15 years (and probably for many more years). To comply with the cited provisions of the Standard, requires the adaptation of these well-known principles and techniques to the coke oven equipment at issue.

Environmentally equipped cabs have been used on cranes, since at least 1975 at the Shenango Inc. Foundry in Pittsburgh, at Wheeling-Pittsburgh's Allenport Works and at Stackpole Carbons Plant at St. Mary's, Pennsylvania.

These adaptations have been made for coke oven equipment, and environmentally controlled cabs successfully used, since at least 1974 at National Steel's Weirton coke ovens; Browns Island coke oven facility; Bethlehem Steel's coke ovens at both its Franklin and Rosedale Plants, and at Wheeling-Pittsburg's coke oven facility. In 1976, Bethlehem's coke works at Bethlehem, Pennsylvania, were equipped with such cabs.

In 1975, U. S. Steel "experimented" with such a cab on one of its larry cars and a quench car at its Clairton Works. The "experiment" failed, in part at least, because the cabs were not insulated, (they operated, of course, on top of or right alongside of the coke ovens

in very high temperatures) they were not sealed, making positive pressure impossible, and there is some indication that they may have been operated at times with their doors and windows open. Thus, not surprisingly, the "experiment" failed, as the air conditioning compressors and electric drive motors, being operated 24 hours a day, burned out.

It was not until either late in 1976 or perhaps after January 1, 1977, that U. S. Steel, retained the services of an outside air conditioning firm, "Busch" in Pittsburgh to produce the environmental booths with scheduled delivery in three to four months after an order was placed. The unit finalized upon by U. S. Steel, and being produced by Busch is roughly 2-1/2' x 3' x 5' high, and is intended to be utilized on all the coke oven machinery as well as constituting stationary standby pulpits, dealt with infra.

Respondent agrues that it is equipping the Fairless Batteries, "at the earliest possible time" and thus can not be held in violation as alleged. This argument is not persuasive.

These Items, (as well as the next two dealt with infra), clearly depict Respondent's attitude regarding compliance with the new Coke Oven Standard.

Respondent's "Compliance Program"[17/] (mandated by Section .1029 (f)(6) of this Standard), called for installation of these types of cabs at various times, beginning in the third quarter of 1978 with

17/ The evidence reveals that this "Compliance Program" was drafted by management and promptly filed away, not circulated to those at Fairless who might be involved in actually accomplishing compliance with the Standard, "as soon as possible."

completion by the second quarter of 1979 - a period of nine months. However, after the OSHA inspection, the completion time for its push side door machines, both batteries was "revised" from the first quarter of 1979 to the fourth quarter of 1979 - not less than a six month delay - despite the fact, that Busch's delivery schedule for such cabs, was from three to four months. Similarly, the contemplated accomplishment "date" for its coke side door machines, both batteries, under its "Compliance Program", was "revised" after the inspection herein from the second quarter of 1979 to the last quarter of 1979 - a period of not less than six months. (Stipulation, pp. 34, 35, 60, 61)

Such an action by Respondent, unexplained in this record, clearly establishes that Respondent is not committed to providing its Fairless coke oven employees with coke oven emission free cabs, "at the earliest possible time."

Furthermore, the evidence demonstrates that Respondent's attitude in this regard has existed from at least 1975, i.e., since its Clairton "experiment." This "experiment" was obviously doomed to failure from the outset, when it is remembered that coke ovens operate at temperatures in the 2000° F range. How anyone, layman or engineer, could possibly expect to effectively air condition cabs on a larry car - operating atop the ovens, or a quench car - which operates alongside the ovens and is filled with the incadescent coke, when the cabs are neither insulated nor sealed, boggles the mind.

Lastly, compliance with these requirements of the Standard require nothing more than applying long established insulating, air conditioning, and heating knowledge and techniques to coke oven

machinery. To be sure, where such environmental cabs might have to be placed on moving machinery to allow necessary clearances, (a matter of taking measurements and establishing the outside dimensions of the machinery to allow passage by obstructions), or the location of the cabs so that the employees may effectively perform their duties, requires some engineering efforts. However, to expect to take three years to accomplish these engineering tasks as well as to fabricate and install these cabs, (from January, 1976, to the end of 1979) clearly establishes that U. S. Steel at Fairless intends to comply with these requirements, "at the latest possible time"[18/] not "at the earliest possible time."

The violations as alleged are established by the evidence of record.

SERIOUS CITATION NO. 1 - ITEM NO. 13

SERIOUS CITATION NO. 2 - ITEM NO. 15

These Items charge that Respondent failed to provide positive pressure, temperature controlled, filtered air standby pulpits on the topside of both batteries, and at the coke wharf, as mandated by Section .1029(f)(4)(i) of the Standard.

The Stipulation establishes the absence of the required standby pulpits at the specified locations. (Stipulation, pp. 37, 38, 61)

---

18/ The "latest possible date" for implementation of the engineering and work practice controls, is January 20, 1980, see Section .1029(f)(1)(i).

Additionally, the Stipulation sets forth, that, "Respondent's compliance program at the time of the inspection contained an anticipated installation dated of the fourth quarter of 1977. The equipment has been ordered and Respondent anticipates installation in the third quarter of 1978." (Stipulation, pp. 37, 38, 62)

According to Respondent's witness Mr. Hill, the anticipated delivery time for these units, which are identical to the units (i.e., cabs) that U. S. Steel intends to install on its mobil equipment at each battery, discussed in the prior two Items, is from three to four months. Thus, the conflicting statement in the Stipulation quoted above, (i.e., the nine month time lag between the two "installation" dates) unexplained in this record, again demonstrates the lack of a commitment by U. S. Steel to provide these environmentally controlled, standby pulpits to its coke oven employees, "at the earliest possible time."

This lack of commitment is even clearer in these two Items than in the preceding two, in that, these pulpits are stationary. Thus, the "clearance" problems, such as they might have been, with the cabs on the mobil equipment, are not present here.

Further, environmentally controlled pulpits, (or booths) as alluded to in the preceding two Items, have been a means of removing employees from hazardous environments, recognized by competent industrial hygienists and facility engineers for not less than two years prior to the inspection herein. In fact, the evidence reveals that not less than three such booths or pulpits have been in use at the Koppers Company coke oven batteries in St. Paul, Minnesota since 1975.

It is therefore concluded that utilization of environmentally controlled standby booths has been a technique to reduce coke oven employees exposure to coke oven emissions which was available since 1975 and known to competent industrial hygienists and facility engineers. Respondent's failure to provide its coke oven employees with such booths, at the time of the inspection, (and which will not be supplied, at best, until the third quarter of 1978), was a failure to implement this control "at the earliest possible time."

The violations as alleged are established in this record.

SERIOUS CITATION NO. 3 - ITEM 1(a), (b) and (c)[19/]

Item 1(a) and (b) charge that respirators were not inspected routinely before and after each use (1(a)), and were not collected, cleaned and disinfected as frequently as necessary to insure that proper protection was provided the coke oven employees on both batteries. Item 1(c) charges that Respondent did not assure the use of respirators by the door machine operators on the coke side of both batteries and by the larry car operator on Battery No. 1, in the vicinity of visible emissions. Section .1029(g)(3) of the coke oven Standard mandates the institution of a respiratory program in accordance with the Standard set forth at 29 C.F.R. 1910.134. The 1910.134 Standard, in relevant part, mandates the inspection and cleaning procedures set forth supra.
